Publication (reference)	<p>The overall study data have not been published yet, however, publications about part of the data have been presented at the 2007 ASCO prostate cancer symposium:</p> <p>C. N. STERNBERG, H. DUMEZ, H. VAN POPPEL, I. SKONECZNA, A. SELLA, G. DAUGAARD, T. GIL, J. GRAHAM, P. CARPENTIER, L. COLLETTE for the EORTC Genitourinary Group, Brussels, Belgium. Multicenter randomized EORTC trial 30021 of Docetaxel + Oblimersen and Docetaxel in patients (pts) with hormone refractory prostate cancer (HRPC). ASCO Prostate Cancer Symposium, Orlando, Florida, 22-24 February 2007 (Oral).</p>													
Objective(s)	<p>The primary objective of the trial is to evaluate the toxicity and activity (in terms of PSA response) of the combination of docetaxel and oblimersen in hormone refractory prostate cancer. The group treated with docetaxel alone will serve as a reference group to further validate the sample used in the trial. The trial is based on a Bryant and Day design and therefore two primary endpoints are considered :</p> <ul style="list-style-type: none"> • PSA response • Major toxic event <p><i>Success criterion required lower bound of 80%CI for PSA response (Bubley) rate > 30% and upper bound of 80%CI for major toxic event rate <45%. RECIST was used for measurable lesions</i></p> <p>The secondary objectives of the trial are to assess time to progression, progression-free survival, toxicity and overall survival in the two treatment groups.</p>													
Methodology	Randomized Phase II trial													
Number of patients Number planed (Statistical design) Number analyzed	115 entered Planned sample size 102 patients in the “per protocol population”. Diagnosis and main criteria for inclusion	<ul style="list-style-type: none"> Prostate cancer patients with PSA progression under prior hormonal treatment (Bubley criteria) – PSA \geq 5 ng/ml. No evidence of painful and / or destructive bone metastases for which RT, bisphosphonates or bone-seeking radionucleotides are considered necessary. No brain metastases Castrate level of testosterone (\leq 50 ng/ml). Patients on medical castration (LHRH) must continue treatment. No pre-treatment with chemotherapy (prior Estramustine allowed). No prior use of bone-seeking radionucleotides nor RT involving > 25 % of marrow producing area. Prior bisphosphonates allowed. WHO performance status 0-2 	
Treatment Test product, dose and mode of administration (batch number if applicable) Duration of treatment	Oblimersen 7 mg/kg/day d1- 7 of each cycle Docetaxel 75 mg/m ² is given with dexamethasone premedication over 60 minutes on d5 of each cycle. Cycle duration is 3 weeks 12 cycles of treatment	
Reference therapy, dose and mode of administration (batch number if applicable)	Docetaxel 75 mg/m ² is given with dexamethasone premedication over 60 minutes on d1 of each cycle. Cycle duration is 3 weeks	
Criteria for evaluation Efficacy	Primary endpoint: <i>PSA response</i> Secondary endpoints: <i>Time to progression, Overall survival, Progression-free survival.</i> <ul style="list-style-type: none"> PSA response defined as a 50% decline from baseline value confirmed by a second value obtained at least 4 weeks apart according to Bubley (Bubley GJ, Carducci M, Dawson N, Daliani D, Eisenberger M, Figg WD et al. Eligibility and response

<p>guidelines for phase II clinical trials in androgen-independent prostate cancer: recommendations from the Prostate-Specific Antigen Working Group. <i>J Clin Oncol</i> 1999;17(11):3461-7; with erratum in <i>J Clin Oncol</i> 2000; 18(13): 2644)</p> <ul style="list-style-type: none"> • PSA progression is defined as follows: <ol style="list-style-type: none"> 1. For patients without PSA decrease since entry on study, progression is an increase of 25% over baseline value, by at least 5 ng/ml (HYBRITTECH equivalent). 2. For patients whose PSA has decreased but has not reached the response criteria, progressive disease is defined as an increase of 25% in PSA value taking as reference the nadir provided that this increase in the absolute value exceeds 5 ng/ml (HYBRITTECH equivalent). 3. For patients who had a PSA response, progressive disease is defined as a 50% increase over the nadir if it is more than 5ng/ml (HYBRITTECH equivalent). <p>The date of PSA progression is the date of the first PSA increase defined according to the definition of PSA progression as defined above.</p> <p>To be assigned a status of PSA progression, changes in the PSA level should be confirmed by repeated measures that should be performed not less than 4 weeks after the first 25% or 50% increase (progression, see above).</p> <ul style="list-style-type: none"> • Objective response and progression criteria are essentially based on a set of measurable lesions identified at baseline as target lesions, and followed until disease progression. In this trial, only few patients are expected to present with measurable disease at entry on study. <p>The complete criteria are included in the published RECIST document (P. Therasse, S.G. Arbuck, E. Eisenhauer et al. New Guidelines to Evaluate the Response to Treatment in Solid Tumors. <i>JNCI</i> 92:3, 2000) also available at http://ww3.oup.co.uk/jnci/extra/920205.pdf.</p> <p>The date of first objective progression is the first date when one or more of the above criteria are met.</p> <ul style="list-style-type: none"> • Time to progression is counted from the date of randomization to the date of the first event of PSA progression (as defined above) or objective clinical progression or death due to the disease. Patients who start another treatment in absence of disease progression will be considered as failures at the time they started the new treatment. Patients without the event of interest will be censored at the date of most recent follow-up visit. • Overall survival is counted from the date of randomization. Patients who die are reported as events, irrespective of the cause of death. Patients without the event of interest are censored at the time of most recent follow-up visit. Overall survival duration therefore is the number of days elapsed between the day of randomization and the day of death or most recent follow-up visit.

Safety	<ul style="list-style-type: none"> • Progression-free survival is counted from the date of randomization until the date of first progression as defined above or the date of death, whichever occurs first. Patients who start another treatment in absence of disease progression will be considered as failures at the time they started the new treatment. Patients without the event of interest are censored at the time of most recent follow-up visit. Progression-free survival duration is therefore the number of days elapsed between the day of randomization and the minimum of the date of PSA progression, the date of objective clinical progression, the date of death or most recent follow-up visit <p>Primary endpoint: <i>Major toxic event</i></p> <p>Secondary endpoints: <i>Adverse events (CTCAE, version 3.0)</i></p> <p>Major toxic event:</p> <p>Severe toxic events are defined as any events of</p> <ul style="list-style-type: none"> • Any grade 4 haematological and non hematological toxicity except asymptomatic grade 4 neutropenia ($ANC < 500/mm^3$) lasting less than 7 days • Febrile neutropenia grade 3 for > 5 days or any Grade 4 febrile neutropenia • Sepsis (=grade 3 or 4) • Severe (grade 3 or 4) hemorrhage-bleeding associated with grade >2 thrombocytopenia ($< 50.000/mm^3$) • Renal toxicity grade 3 or 4 (serum creatinine > 3xULN or need of dialysis) • Stop of treatment due to unacceptable toxicity • Death at least possibly due to toxicity 	
Statistical methods	<p>This trial is a randomized phase II design. A 1-stage Bryant and Day decision rule will be applied separately to the two treatment arms.</p> <p>The two primary endpoints of the trial are PSA response and Major toxic events</p> <p>The parameters of the design are:</p> <ul style="list-style-type: none"> ◆ Type I error rate (α) for the endpoint major toxic event: 10% ◆ Type I error rate (α) for the endpoint PSA response: 10% ◆ Type II error rate (β) for both endpoints: 10% ◆ P0 (maximum <u>insufficient</u> response rate): 30% ◆ P1 (minimum <u>acceptable</u> response rate): 50% ◆ T0 (maximum <u>unacceptable</u> rate without severe toxic event: 55% (i.e.: minimum <u>unacceptable</u> severe toxic event rate 45%) ◆ T1 (minimum <u>acceptable</u> rate without severe toxic event): 75% (i.e.: maximum <u>acceptable</u> severe toxic event rate 25%) <p>According to this design, the study requires 51 patients in each treatment group. The main analysis of the primary trial endpoints is carried out in the “per protocol</p>	

Name of Sponsor/Company: EORTC	Individual study Table Referring to Part of the Dossier	<i>(For National Authority Use Only)</i>
Name of the finished product	Volume:	
Name of Active Ingredient	Page	
	<p>population” (all eligible patients having started their allocated treatment), the protocol thus requires a total of 102 patients in the “per protocol population”.</p> <p>A treatment arm is considered to be sufficiently active and safe if ≥ 20 of the 51 patients have a PSA response ($\geq 39.2\%$) and if ≤ 18 of the 51 patients ($\leq 35.3\%$) experience a major toxic event. The treatment that fulfills both conditions is considered worth evaluating in a phase III trial.</p> <p>If ≤ 19 of the 51 patients have a PSA response, the treatment is not considered sufficiently active to warrant evaluation in the phase III setting.</p> <p>If ≥ 19 of the 51 patients experience a major toxic event, the treatment is judged too toxic to warrant further evaluation in this patient population.</p>	
Summary of Results Efficacy Results	<p>The trial recruited 115 patients between 16 April, 2004 and 17 January, 2006.</p> <p>Patients with metastatic hormone-refractory prostate cancer were randomized between Docetaxel (Arm A) and Oblimersen with Docetaxel (ARM B).</p> <p>4 patients were not evaluable on B (2 ineligible and 2 untreated due to immediate progression). Median age was 68.9 years on A and 64.4 years on B. Of 111 evaluable patients, 7 entered with PSA progression only, 43 with PSA+bone progression and 61 with visceral mets, 49 had measurable disease.</p> <p>PSA response rate was 45.6% on A (80%CI: 36.5-54.9%) and 37.0% on B (80%CI: 28.2-46.6%).</p> <p>Partial responses (RECIST) were observed in 5/28 and 5/21, respectively.</p> <p>1-year survival rate was 85.4% on A vs 81.2% on B.</p> <p>Median PFS was 6.2 m on A vs 4.4 on B.</p>	
Safety Results	<p>Grade 3/4 toxicities on A vs B: fatigue 1.8% vs 13.0%; febrile neutropenia 14.0% vs 13.0%; infection 15.8% vs 16.8%; diarrhea 5.3% vs 9.3%; mucositis 1.8% vs 9.3%; neutropenia was 84.2% vs 79.7%. Growth factors was given to 9 (15.8%) and 14 (25.9%).</p> <p>Toxic deaths occurred in 1 pt in each arm.</p> <p>Major toxic event rate was 24.6% on A (80%CI: 17.2-33.4) and 42.6% on B (80%CI: 33.4-52.2%).</p>	
Conclusions	<p>This is the first evaluation of the concept of lowering Bcl-2 prior to Docetaxel chemotherapy in HRPc. Addition of Oblimersen to Docetaxel did not increase PSA response nor survival and was associated with increased side effects.</p>	
Date of Report	Final analysis report : 05-02-2008
