

The study entitled " SUPRAFYSIOLOGINEN HYDROKORTISONI VAIKEASSA AKUUTISSA HAIMATULEHDUKSESSA", EudraCT number 2008-002346-30 was prematurely ended because of slow recruitment. Enrollment of study patients began in April 2010 and after 20 months we were able to randomize only four patients. The inclusion criteria in the protocol were too strict, which made it nearly impossible to find a suitable patient for the study. Therefore, the study group determined to end the study in December 2011. Because there were only four randomized patients, no data-analysis was done.
