

Effect of Thienopyrididine derivative (clopidogrel) on the disposition of Efavirenz and Nevirapine in HIV positive patients

Sponsor's refs: RLBUHT 3729, UoL 000399

EudraCT number: 2008-006371-67

REC reference: 09/H1010/6

The trial has terminated early due to the reasons discussed below.

1. Recruitment to the nevirapine arm of the study has been very slow. Given the declining use of nevirapine in clinical practice this is unlikely to improve.
2. Recruitment to the efavirenz arm of the study has slowed down.

The decision has been taken to analyse the samples collected throughout the trial due to concerns over sample integrity. As this was a pilot study it was decided that although numbers were small, if any substantial findings were made that it would be more beneficial to design a new trial to investigate the findings further.

All subjects recruited to the trial had completed the trial prior to the early termination.
