## 1. TITLE PAGE

### CLINICAL STUDY REPORT

**A Dose-Finding Study of Efficacy and Safety of F13640 (Befiradol) in Patients with Moderate to Severe Painful Peripheral Diabetic Polyneuropathy.  
BEST-Diabetes Study (Befiradol Dose-Finding Study in diabetic patients)**

**Investigational Product:** Befiradol tablets (0.25 and 0.50 mg)

**Study Design:** Multicentre, randomised, double-blind, placebo-controlled study on 4 parallel groups: 1, 2 or 3 mg/day and placebo

**Protocol Number:** F13640 CP 2 01

**EudraCT Number:** 2009-012123-28

**Phase of Development:** II

**Date of First Enrolment:** 27 October 2009

**Date of Last Completed:** 09 December 2010

**Coordinator:** Prof Paul VALENSI, MD, *Hôpital Jean Verdier, Avenue du 14 juillet, 93140 Bondy, France: +33 (0)1 48 02 65 96*

**Sponsor Representatives for Study Report:** Clinical Study Director: Marie-Thérèse Pétrissans, MD: +33 (0)5 34 50 63 42  
Clinical Study Managers: Christine Métails / Carine Fabre: +33 (0)5 34 50 63 54 / 63 57  
Pharmacokinetic Study Managers: Laurence Barthe / Laurence Del Frari: +33 (0)5 34 50 63 91/ 63 90  
Project Statistician: Mélanie Groc: +33 (0)5 62 24 27 89  
Medical Writer: Agnès Montagne, MD: +33 (0)5 34 50 63 50

**Date of Report:** **07 November 2011**

Study performed in compliance with Good Clinical Practice.

This information may be disclosed in whole or in part, submitted for publication, or form the basis for an industrial property licence only with the written approval of Pierre Fabre Médicament. Pierre Fabre Médicament is the owner of this report.

## 2. SYNOPSIS

Name of Company: Pierre Fabre Médicament		Individual Study Table Referring to Module 5 of the Dossier Vol.: .....Page: .....	(For National Authority Use Only)
Name of finished product:			
Name of active substance (or ingredient):			
Title of Study:		A dose-finding study of efficacy and safety of F13640 (befiradol) in patients with moderate to severe painful peripheral diabetic polyneuropathy.	
Abbrev.		BEfiradol Dose-Finding Study in diabetic patients (BEST-Diabetes study).	
International Coordinating Investigator:		Prof Paul Valensi, MD, <i>Hôpital Jean Verdier, Avenue du 14 juillet</i> , 93140 Bondy, France	
Investigators:		317 potentially recruiting investigators in 10 European countries: Bulgaria (B), Croatia (C), Czech Republic (CR), France (F), Germany (G), Hungary (H), Lithuania (L), Russia (R), Serbia (Se), and Slovakia (SI).	
Study Centres:		80 recruiting centres: B (4), C (4), CR (11), F (3), G (12), H (7), L (5), R (21), Se (5), and SI (8), specialised in Endocrinology/Diabetology (71%), Neurology (25%) or Internal Medicine (4%); mainly hospital structures (59%).	
Publication (reference):		Not written	
Study Period: date of first enrolment date of last completed		13.4 months: 27 October 2009 09 December 2010	Phase of development: II
Objectives:		<p><b>Primary:</b> to define the dose-response relationship of befiradol (a selective 5-HT<sub>1A</sub> receptor agonist) compared to a placebo with respect to analgesic efficacy and safety in patients with moderate to severe diabetic peripheral neuropathic pain (DPNP);</p> <p><b>Secondary:</b></p> <ul style="list-style-type: none"> <li>- To evaluate, after study treatment discontinuation, potential rebound, addiction, or remanent effects;</li> <li>- To perform a descriptive analysis of befiradol plasma concentrations.</li> </ul>	
Methods:		<ul style="list-style-type: none"> <li>- Multicentre, randomised, double-blind, placebo-controlled study on 4 parallel groups (3 doses of befiradol: 1, 2 or 3 mg/day and placebo).</li> <li>- Maximum study duration: 108 days: <ul style="list-style-type: none"> <li>• Selection period including a period of wash-out of the previous prohibited treatments up to 28 days (i.e., to a maximum of 5 T½ of the prohibited treatments) followed by a 7-day stabilisation period for the validation of the inclusion criteria related to the pain intensity score;</li> <li>• Treatment period (66 days) including an 11-day progressive up-titration, a fixed dose period and a 10-day progressive down titration;</li> <li>• Single-blind placebo follow-up period (7 days).</li> </ul> </li> <li>- 7 study visits: Selection, Randomisation, Day (D)12, D29, D56 (or End of Fixed Dose [EFD]), D66 (or end of Down Titration [EDT]), D73 (or Study Termination [ST]);</li> <li>- 4 phone calls: at D-7, D6, D18 and D60.</li> <li>- Patient Electronic Diary (PED) to capture pain data for primary criterion calculation.</li> </ul>	
Number of Patients:		456 randomised and treated patients: 112, 113, 114, and 117 patients in the Placebo, 1 mg, 2 mg, and 3 mg groups, respectively.	
Diagnosis and Main Criteria for Inclusion (1/2):		<ul style="list-style-type: none"> <li>- Male or female patient aged 18 to 65,</li> <li>- Moderate-to-severe DPNP, with: <ul style="list-style-type: none"> <li>• Michigan Neuropathy Screening Instrument (MNSI) score <math>\geq 3</math>,</li> <li>• Pain persisting for <math>\geq 3</math> months,</li> <li>• Diabetes mellitus <math>\geq 3</math> years, stable glycaemic assessment for <math>\geq 3</math> months, Haemoglobin A1c (HbA1c) <math>&lt; 10\%</math> at Selection.</li> </ul> </li> </ul>

**Summary – Conclusions (1/4)**

**Patients**

**Disposition**

651 patients were screened, of whom, 457 (87.9%) were randomised (from 5 in France to 170 in Russia): 113, 113, 114, and 117 in the Placebo (PBO), Befiradol (BFL) 1 mg, BFL 2 mg, and BFL 3 mg groups, respectively. All randomised patients received at least one dose of study treatment except 1 PBO patient.

The patient disposition from randomisation to study completion is tabulated below (several reasons may have led to the PW). There was an increase with the dose in the incidence of PWs for safety concern, and no between-group difference for PWs due to other reasons than safety concern.

	Placebo	BFL 1mg	BFL 2mg	BFL 3mg	Total
<b>Randomised</b>	<b>113</b>	<b>113</b>	<b>114</b>	<b>117</b>	<b>457</b>
<b>Prematurely Withdrawn</b>	<b>13 ( 11.5 %)</b>	<b>9 ( 8.0 %)</b>	<b>14 ( 12.3 %)</b>	<b>24 ( 20.5 %)</b>	<b>60 ( 13.1 %)</b>
<i>Safety Concern</i>	2 ( 1.8 %)	4 ( 3.5 %)	8 ( 7.0 %)	14 ( 12.0 %)	28 ( 6.1 %)
<i>Therapeutic Failure</i>	4 ( 3.5 %)	1 ( 0.9 %)	2 ( 1.8 %)	3 ( 2.6 %)	10 ( 2.2 %)
<i>Other Reason*</i>	8 ( 7.1 %)	5 ( 4.4 %)	4 ( 3.5 %)	9 ( 7.7 %)	26 ( 7.7 %)
<b>Completers</b>	<b>100 ( 88.5%)</b>	<b>104 ( 92.0%)</b>	<b>100 ( 87.7%)</b>	<b>93 ( 79.5%)</b>	<b>397 ( 86.9%)</b>

*\*exclusive of the other classes; including 1 loss to follow-up in the PBO group*

The patient disposition across the different data sets analysed was the following:

	Placebo	BFL 1mg	BFL 2mg	BFL 3mg	Total
<b>FAS</b>	112	113	114	117	456
<b>PP Set</b>	97	90	97	91	375
<b>Rebound Analysis Set</b>	98	100	100	90	388
<b>PK Set</b>	N/A	94	96	96	286

**Baseline Characteristics (FAS sample)**

Overall, 53.7% of patients were women, 98.2% of patients were Caucasians, the age was 55.1 years on average and ranged between 20 and 66 years, the BMI was 31.0 kg/m<sup>2</sup> on average and ranged between 12.1 and 48.6 kg/m<sup>2</sup>; with 57.7% of obese patients.

Type 2 / type 1 diabetes ratio was ~4.8; the mean ages of diabetes and diabetic neuropathic pain (DNP) were 12.0 and 3.8 years, respectively. The mean HbA1C level was 7.6%; ~76% of patients had a concomitant hypertension.

The overall mean (SD) 24 h-recall pain VAS score at selection, 64.0 (11.5) mm, reflected a moderate-to-severe intensity of pain in the study sample.

Treatment groups did not relevantly differ (difference >10%) with respect to demographic and other baseline characteristics except:

- A higher proportion of female patients in the BFL 3 mg group (63.2% vs. 50.4% in the other groups as a whole);
- A higher proportion of smokers (including ex-smokers or not) in the PBO group (40.2% and 25.0% , respectively, vs. 30.5% and 13.6%, respectively in the BFL groups as a whole); among smokers (including ex-smokers), a higher daily consumption of cigarettes in the BFL 2 mg group: 20.2 vs. 15.1 in the other groups as a whole;
- A higher use of insulin and analogues in the BFL 1 mg and 3 mg groups (63.7% and 65.0%, respectively) than in the PBO (54.5%) and BFL 2 mg group (54.4%);
- A lower use in the BFL 3 mg group of antithrombotic agents (23.1% vs. 31.6% in the other groups as a whole) and calcium channel blockers (12.8% vs 23% in the other groups as a whole).

**Efficacy Results (1/2)**

In the FAS sample, the proportion of 30%-responders on the e-Diary 24 h-Recall Pain VAS Intensity weekly-averaged over the last fixed dose week (Week 8-LOCF), was non significantly higher in either BFL group than that in the PBO group (results in bold type in the following table; minimum CMH p<sub>a</sub> value: 0.87 [BFL 3 mg group vs. PBO group]); a result unchanged in the PP data set. Although increasing with the dose, there was no significant dose effect on this 30% responder rate.

<b>Summary – Conclusions (2/4):</b>					
<b>Efficacy Results (2/2)</b>					
The following table summarises the main results of the efficacy criteria. Consistently with the results on the primary criterion (in bold type), improvements in pain and PGIC scales were higher (and tended to increase with the dose) in the BFL groups than in the PBO group, but the difference vs. PBO never reached the statistical significance for either BFL group.

<b>Pharmacokinetic (PK) Results</b>					
810 plasma concentrations from the 286 patients administered with befiradol were used to perform the descriptive PK analysis. Plasma concentrations of befiradol increased when administered dose increased. After close visual inspection of range of concentrations and graphs, no gender effect could be evidenced whatever the dose. In addition, the concentrations observed in patients who took concomitant CYP450 3A4 inducer or inhibitor, remained in the range of concentrations observed in patients without such concomitant medication.					
<b>Safety Results (1/3)</b>					
<b>Adverse Events (1/2)</b>					
4 SAEs (1 in each group) were reported, all treatment-emergent, and none having been suspected as drug-related either by the Investigator or the Sponsor: a sudden death in the PBO group, an angina pectoris in the BFL 1 mg group, a pneumonia in the BFL 2 mg group and a hypertension (aggravated) in the BFL 3 mg group.					
Overall, there was an increase (or trend to increase) with the dose ( <i>i.e.</i> , predominantly in $\geq 1$ of the 2 highest BFL doses) in the:					
<ul style="list-style-type: none"> <li>- Number of TEAE occurrences (67 in the PBO group, and 132, 167 and 180 in the BFL 1, 2 and 3 mg groups, respectively) and corresponding incidence (25.9% in the PBO group and 39.8%, 49.1% and 46.2% in the BFL 1, 2 and 3 mg groups, respectively);</li> <li>- Proportion of drug-related TEAEs (46.3% in the PBO group, and 49.2%, 62.3% and 72.2% in the BFL 1, 2 and 3 mg groups, respectively) and corresponding incidence (11.6% in the PBO group and 19.5%, 32.5% and 35.0% in the BFL 1, 2 and 3 mg groups, respectively);</li> <li>- Number and incidence of AEs leading to definitive study treatment discontinuation (8 in 0.9% of patients in the PBO group vs. 11 to 40 in 3.5% to 12.0% of patients in the BFL groups).</li> </ul>

**Summary – Conclusions (3/4):**  
**Safety Results (2/3)**  
**Adverse Events (2/2)**

The most common TEAEs (in  $\geq 5\%$  of patients in any group),

- With an increase (or trend to increase) with the dose in their incidence, were: dizziness (2.7%/PBO vs. 8.8% to 15.4%/BFL), nausea (4.5%/PBO vs. 7.1% to 15.4%/BFL), headache (4.5%/PBO vs. 8.8% to 11.1%/BFL), hypertension (0/PBO vs. 1.8% to 5.1%/BFL), and withdrawal syndrome (2.7%/PBO and 3.5% to 5.1%/BFL);
- Of higher incidence in  $\geq 1$  BFL group than in the PBO group, with no apparent increase with the dose, were: insomnia (0.9%/PBO vs. 6.0 to 7.9%/BFL), and paraesthesia (2.7%/PBO and 2.6% to 5.3%/BFL); almost all TEAEs were of mild or moderate severity (~99% and ~97% TEAEs in the PBO group and BFL groups as a whole, respectively). The proportion of TEAEs of moderate severity was the highest in the BFL 3 mg group (mainly hypertension and psychiatric TEAEs).

The most common **drug-related** TEAEs (incidence  $> 2\%$  of patients in either group) were the following:

PT	PBO n=112	BFL 1 mg n=113	BFL 2 mg n=114	BFL 3 mg n=117
Dizziness	1 (0.9%)	8 (7.1%)	15 (13.2%)	15 (12.9%)
Nausea	4 (3.6%)	6 (5.3%)	12 (10.5%)	16 (13.7%)
Headache	3 (2.7%)	3 (2.7%)	6 (5.3%)	9 (7.7%)
Insomnia	-	3 (2.7%)	3 (2.6%)	6 (5.1%)
Withdrawal syndrome	1 (0.9%)	4 (3.5%)	4 (3.5%)	5 (4.3%)
Paraesthesia	1 (0.9%)	3 (2.7%)	4 (3.5%)	2 (1.7%)
Vomiting	-	-	-	5 (4.3%)
Hypotension	-	3 (2.7%)	2 (1.8%)	2 (1.7%)
Accidental overdose	1 (0.9%)	3 (2.7%)	3 (2.6%)	2 (1.7%)
Hypertension	-	1 (0.9%)	1 (0.9%)	3 (2.6%)
Mood Swings	2 (1.8%)	-	2 (1.8%)	3 (2.6%)
ALAT increased	1 (0.9%)	1 (0.9%)	3 (2.6%)	-

~70% of definitive treatment discontinuations due to drug-related TEAEs in the BFL groups occurred before the end of the 1<sup>st</sup> week of the fixed dose period. TEAEs leading to definitive treatment discontinuation were mainly (number of AEs in the PBO, BFL-1 mg, -2 mg, and -3 mg groups respectively): nausea (1, 2, 4, and 8 [+1 vomiting]) and dizziness (0, 1, 3 [+2 vertigo + 1 vestibular disorder], and 5).

TEAEs with the earliest onset were dizziness and nausea (generally during the up-titration period); then, hypotension and asthenia (generally within the first 4 weeks). Hypertension occurred more likely during the fixed dose period; whereas myalgia generally occurred during the down-titration or follow-up periods. The other AEs were either rare or had no specific onset period.12.6

Drug-related withdrawal syndromes with consistent date of onset (*i.e.*, at or after the end of fixed dose period) were reported in 1, 3, 3, and 2 patients in the PBO, BFL 1, 2 and 3 mg groups, respectively. The following withdrawal symptoms occurred specifically in the BFL groups: mood swings (3), dizziness (2), confusional state (1), visual hallucination (1), and nightmare (1). Of the 18 accidental overdoses reported in the BFL group (*vs.* 1 in the PBO group), 3 possibly resulted in an AE: a dizziness in 2 cases, and a severe paroxysmal tachycardia + mild facial hypoesthesia in 1 case. The latter case led to a definitive treatment discontinuation.

**Laboratory Tests (1/2)**

At baseline, there were, in the whole study sample, trends to hyperglycemia, hypertriglyceridemia, and to poor hepatic (ALAT, GGT) and renal (creatininemia and MDRD creatinine clearance) functions. The BFL 2 mg group showed the most impaired means for most of these parameters, except for renal parameters.

The mean time profiles of all lab parameters showed no relevant between-group differences.

In post-baseline, the most relevant findings were the following:

- CNALVs resulting from potentially significant changes (PSCs) or drug-related TEAEs of increased hepatic parameters were reported in more patients in the BFL 1 mg and 2 mg groups (6 and 9, respectively) than in the PBO and BFL 3 mg groups (3 and 2, respectively) whereas significant increases ( $> 2$  ULN) in hepatic enzymes were recorded in more patients in the BFL 2 mg group (8) than in the other groups: 2, 3 and 1 patients in the PBO, BFL 1 mg and BFL 3 mg groups, respectively;
- Incidence of PSCVs of increased creatininemia tended to increase with the dose (recorded in 1, 1, 3 and 4 patients in the PBO, BFL 1 mg, BFL 2 mg and BFL 3 mg groups, respectively). A similar trend was observed for the PSCVs of increased kaliemia (recorded in 2, 1, 1 and 5 patients in the PBO, BFL 1 mg, BFL 2 mg and BFL 3 mg groups, respectively). However, relevant CNALVs of increased creatininemia or drug-related TEAEs of renal impairment were reported in 1 to 2 patients of either group.

<b>Name of Company: Pierre Fabre Médicament</b>	<b>Individual Study Table</b>	<b>(For National Authority Use Only)</b>
<b>Name of finished product: Befiradol</b>	<b>Referring to Module 5 of the Dossier</b>	
<b>Name of active substance (or ingredient):</b>	<b>Vol.: .....Page: .....</b>	
<p><b>Summary – Conclusions (4/4):</b></p> <p><b>Safety Results (3/3)</b></p> <p><b>Vital Signs</b></p> <p>The mean time profiles of all vital signs showed no relevant between- or within-group differences.</p> <p>Clinically significant (CS) abnormalities of high blood pressure (BP) were presented by a higher number of patients in the BFL groups (with no increase with the dose) than in the PBO group: 7, 14, 13, and 15 patients in the PBO, BFL 1 mg, BFL 2 mg, and BFL 3 mg groups, respectively; the difference was mainly related to high PSCs of SBP (<math>\geq 30</math> mmHg) or DBP (<math>\geq 25</math> mmHg) increase (1, 6, 8 and 7 patients, respectively) and TEAEs of “hypertension”/“BP increased” (0, 5, 3 and 6 patients, respectively); the relationship of the TEAE with the study drug was not excluded in 0, 1 (suspected, but onset at D66/EDT Visit), 1 (insufficient data), and 3 (insufficient data in all cases, but onset at D66/EDT Visit in 1 case) patients, respectively.</p> <p>CS abnormalities of low BP were presented by 6, 10, 4 and 8 patients in the PBO, BFL 1 mg, BFL 2 mg and BFL 3 mg groups, respectively. Among them, TEAEs of “hypotension” were reported in 0, 3, 2 and 2 (3 occurrences) patients, respectively; the relationship of the TEAE with the study drug was suspected in all cases (except for 1 occurrence in the BFL 3 mg patient). There was no signal of orthostatic hypotension occurrence related to BFL administration.</p> <p>CS abnormalities of high HR were presented by 2, 2, 0 and 3 patients in the PBO, BFL 1 mg, BFL 2 mg and BFL 3 mg groups, respectively. Among them, PSCVs were only reported in both PBO patients and TEAEs of “tachycardia” were reported in 2 BFL 3 mg patients; the relationship of the TEAE with the study drug was suspected in 1 case.</p> <p>CS abnormalities of low HR were presented by 3, 1, 4 and 0 patients in the PBO, BFL 1 mg, BFL 2 mg and BFL 3 mg groups, respectively. Among them, only 1 TEAE of “bradycardia” was reported in a BFL 2 mg patient; this TEAE was suspected to be related with the study drug.</p> <p><b>ECG</b></p> <p>At the on-treatment assessment (D56/PW), QTc prolongations <math>&gt; 30</math> ms resulting in a value <math>&gt; 450</math> ms were recorded in a higher proportion in the BFL 1 mg group (6 patients) than in the other groups (0 patient in the PBO and BFL 2 mg groups, 3 patients in the BFL 3 mg group); however, in only 1 case (BFL 1 mg patient), the QTc (QT<sub>CB</sub>) increase was <math>&gt; 60</math> ms (+71 ms) and the resulting QTc (491 ms) was the only resulting QTc <math>&gt; 480</math> ms. The QTc values were normalised at D73/ST. No other clinically relevant ECG abnormalities were recorded or reported as AEs on BFL treatment.</p> <p><b>Conclusion</b></p> <p>The present trial did not allow to demonstrate befiradol efficacy in reducing pain associated with DPN at the doses of 1, 2 or 3 mg daily over 8 weeks of treatment. No bias in the study design, baseline characteristics of the population or study performance was identified that could explain such results. The nature of the most common drug-related AEs, whose incidence increases with the dose, is in line with the known pharmacological activity of befiradol.</p>		
<b>Date of Report: 07 November 2011</b>
