

## SYNOPSIS

<b>Name of Sponsor/Company</b> Sanofi Pasteur MSD S.N.C.	<b>Individual Study Table Referring to Part of the Dossier</b>  Volume  Page	<i>(For National Authority Use only)</i>
<b>Name of Finished Product</b> ZOSTAVAX®		
<b>Name of Active Ingredient</b> Varicella-zoster virus, Oka/Merck strain (live, attenuated)		
<b>TITLE OF STUDY</b> An open-label, randomised, comparative, multicentre study of the immunogenicity and safety of ZOSTAVAX® when administered by intramuscular route or subcutaneous route to subjects ≥50 years of age. Study Identification Number: ZTV03C EudraCT Number: 2009-012458-19		
<b>COORDINATING INVESTIGATORS</b> <ul style="list-style-type: none"> <li>• <b>Germany:</b> Prof. Thomas WEINKE, MD, Klinikum Ernst von Bergmann, Postdam</li> <li>• <b>Spain:</b> Dr. Javier DIEZ-DOMINGO, MD, Centro Superior de Investigación en Salud Pública (CSISP), Valencia</li> </ul>		
<b>STUDY CENTRES</b> 10 active centres, in Germany and Spain.		
<b>PUBLICATION (REFERENCE)</b> Not applicable		
<b>STUDIED PERIOD</b> 16 months (between FVFS and LVLS) First Visit First Subject: 20 June 2011 Last Visit Last Subject: 15 October 2012	<b>PHASE OF DEVELOPMENT</b> Phase 3	
<b>OBJECTIVES</b> <u><b>PRIMARY OBJECTIVE</b></u> The two co-primary objectives were: <ul style="list-style-type: none"> <li>• To demonstrate that ZOSTAVAX® administered by intramuscular (IM) route is non-inferior to ZOSTAVAX® administered by subcutaneous (SC) route in terms of 4-week post-vaccination antibody titres as measured by glycoprotein enzyme-linked immunosorbent assay (gpELISA) to varicella-zoster virus (VZV) in subjects ≥50 years of age.</li> <li>• To demonstrate that ZOSTAVAX® administered by IM route induces an acceptable fold-rise of VZV antibody titres (gpELISA) from pre- to 4-week post-vaccination in subjects ≥50 years of age.</li> </ul> <u><b>SECONDARY OBJECTIVES</b></u> The secondary immunogenicity objectives of this study were:

<b>Name of Finished Product</b> ZOSTAVAX®	Volume		
<b>Name of Active Ingredient</b> Varicella-zoster virus, Oka/Merck strain (live, attenuated)	Page		

- To evaluate the immunogenicity as measured by VZV antibody titres (gpELISA) at 4 weeks following ZOSTAVAX® administered by IM or SC route.
- To evaluate the immune response as measured by a second assay, the VZV Interferon-gamma (IFN-γ)-ELISPOT at 4 weeks following ZOSTAVAX® administered by IM or SC route.

The secondary safety objective of this study was to describe the safety profile of ZOSTAVAX® administered by IM or SC route.

**METHODOLOGY**

Open-label, randomised, comparative, 2 arms, multicentre study. Randomisation was stratified by ELISPOT subset status (ELISPOT site or non-ELISPOT site) and age with 3 strata: 50-59, 60-69, ≥70 years.

During the conduct of the trial the enrolment was monitored to make sure that no single age stratum dominated enrolment. The stratum 50-59 and the stratum ≥70 years had to not exceed one half and one third of the total sample, respectively.

**Table 1. Study Schedule**

Timing	Visit 0 Day -7 to Day 0	Visit 1 Day 0	Visit 2 Day 28 to Day 35
<b>Informed consent</b>	Signed before any study procedure		
<b>Vaccination</b>		ZOSTAVAX® IM or SC route according to randomisation	
<b>Immunogenicity assessment (a)</b>	Blood sample 1 (pre-vaccination)		Blood sample 2 (4-week post-vaccination)
<b>Safety assessment (b)</b>	Record of safety		

(a) Immune responses measured by gpELISA in all subjects and IFN-γ-ELISPOT in the ELISPOT subset

(b) All subjects were kept under medical surveillance for at least 20 minutes post-vaccination to collect all immediate adverse events. Solicited injection-site adverse reactions (injection-site erythema, injection-site swelling and injection-site pain) were collected from Day 0 to Day 4 post-vaccination. Unsolicited injection-site adverse reactions and systemic adverse events and rashes of interest (i.e. Varicella, Varicella-like rashes, Herpes zoster (or shingles) and Herpes zoster-like rashes) were collected from Day 0 to Day 28 post-vaccination. Serious adverse events were collected throughout the study.

<b>STATISTICAL METHODS</b>		
<u><b>IMMUNOGENICITY</b></u>		
<u><b>Primary objective analyses</b></u>		
<p>Immunogenicity was evaluated using a Per Protocol approach (main analysis) and a Full Analysis approach (supportive analysis).</p> <ul style="list-style-type: none"> <li>The 4-week post-vaccination gpELISA GMT in the IM Group was considered as non-inferior to the 4-week post-vaccination gpELISA GMT in the SC Group if the lower bound of the two-sided 95% CI around the gpELISA GMT ratio (GMT(Group 1)/GMT(Group 2)) was greater than 2/3 (i.e. ruling out a 1.5-fold decrease or more). This was similar to testing <math>H_0: \text{GMT}(\text{Group 1})/\text{GMT}(\text{Group 2}) \leq 2/3</math> versus <math>H_1: \text{GMT}(\text{Group 1})/\text{GMT}(\text{Group 2}) &gt; 2/3</math>.</li> </ul> <p>This hypothesis was tested using a Longitudinal Data Analysis model including pre and post-vaccination log-transformed titres as response variables and age at vaccination, group and visit (pre- and post-vaccination) as covariate.</p> <ul style="list-style-type: none"> <li>The gpELISA GMFR in the IM Group was considered as acceptable if the lower bound of its two-sided 95% CI was greater than 1.4. This was similar to testing <math>H_0: \text{GMFR}(\text{Group 1}) \leq 1.4</math> versus <math>H_1: \text{GMFR}(\text{Group 1}) &gt; 1.4</math>.</li> </ul> <p>This hypothesis was tested using the Student's t distribution for paired samples on log-transformed data.</p>		
<u><b>Secondary objectives analyses</b></u>		
Descriptive statistics were performed including:		
<ul style="list-style-type: none"> <li>gpELISA GMT and GMFR (and two-sided 95% CI) in both groups,</li> <li>IFN-<math>\gamma</math> ELISPOT GMC and GMFR (and two-sided 95% CI) in both groups of the ELISPOT subset.</li> </ul>		
<u><b>SAFETY</b></u>		
A descriptive analysis of the safety profile was provided for each of the two administration routes.		
<b>SUMMARY – CONCLUSIONS</b>		
<u><b>DEMOGRAPHY</b></u>		
<p>The 2 groups were comparable in terms of age, gender, weight and height. On the Randomised Set, the mean age of the 354 subjects was 62.6 years [range: 50.0; 90.5], 44.9% were male. 46.0%, 31.4% and 22.6% of the participants belonged to 50-59 years stratum, 60-69 years stratum and <math>\geq 70</math> years stratum, respectively. Demographic data of the ELISPOT Randomised Subset were comparable to the demographic data of the Randomised Set.</p>		

<b>Name of Sponsor/Company</b> Sanofi Pasteur MSD S.N.C.	<b>Individual Study Table Referring to Part of the Dossier</b>  Volume  Page	<i>(For National Authority Use only)</i>
<b>Name of Finished Product</b> ZOSTAVAX®		
<b>Name of Active Ingredient</b> Varicella-zoster virus, Oka/Merck strain (live, attenuated)		

**IMMUNOGENICITY RESULTS**

**The two co-primary immunogenicity objectives were met:**

- ZOSTAVAX® administered by IM route was non-inferior to ZOSTAVAX® administered by SC route in terms of 4-week post-vaccination VZV antibody titres (gpELISA) in subjects  $\geq 50$  years of age since the lower bound of the 2-sided 95% CI around the estimated GMT ratio IM/SC is greater than 0.67 (see Table 3).
- ZOSTAVAX® administered by IM route induced an acceptable fold-rise of VZV antibody titres (gpELISA) from pre- to 4-week post-vaccination in subjects  $\geq 50$  years of age since the lower bound of the 2-sided 95% CI around the estimated GMFR using the IM route is  $>1.4$  (see Table 4)

Both results were similar for the Full Analysis Set.

**Table 3. Non-Inferiority Analysis of 4-Week Post-Vaccination VZV Antibody Titres {gpELISA units/mL} - IM Route versus SC Route - Per Protocol Set**

	<b>Group 1 - IM route (N=175)</b>	<b>Group 2 - SC route (N=177)</b>
Estimated GMT (a)	402.7	384.9
Estimated GMT ratio IM/SC [95% CI] (a)	<b>1.05 [0.93;1.18]</b>	
p-value (a)	<b>&lt;0.001</b>	
Non-inferiority (b)	<b>Met</b>	

(a) The 4-week post-vaccination estimated responses, GMT ratio (IM/SC), 95% CI and p-value are based on a longitudinal regression model adjusting for pre-vaccination titres and age at vaccination in years.  
(b) Non-inferiority is achieved if the lower bound of the 2-sided 95% CI for the GMT ratio is greater than 2/3.

**Table 4. Pre and 4-Week Post-Vaccination GMT and GMFR of VZV Antibody Titres {gpELISA units/mL} - Per Protocol Set**

	<b>Group 1 - IM route (N=175)</b>		<b>Group 2 - SC route (N=177)</b>	
	<b>Pre-vaccination</b>	<b>Post-vaccination</b>	<b>Pre-vaccination</b>	<b>Post-vaccination</b>
<b>n</b>	175	168	176	173
<b>GMT</b>	144.6	395.3	158.9	391.7
<b>95% CI</b>	[125.3;166.9]	[350.6;445.6]	[137.9;183.1]	[348.9;439.7]
<b>n</b>		168		172
<b>GMFR (Post/Pre-vaccination)</b>		<b>2.7</b>		2.5
<b>95% CI</b>		[2.4;3.0]		[2.2;2.8]
<b>Acceptability (a)</b>		<b>Met</b>		<i>Not applicable</i>
(a) Acceptability is demonstrated if the lower bound of the two-sided 95% CI is $>1.4$ .

No specimen was obtained for PCR testing.</p> <p>No subject was withdrawn due to an AE at any time after ZOSTAVAX® administration. No deaths were reported. Three subjects reported an SAE: 1 subject (Hernia obstructive) in Group 1 (IM route) and 2 subjects (Humerus fracture and Deep vein thrombosis) in Group 2 (SC route). None were assessed as vaccine related by the investigator.</p>		
<b>CONCLUSION</b> <p>In this study, in subjects <math>\geq 50</math> years of age,</p> <ul style="list-style-type: none"> <li>The geometric mean of the VZV gpELISA antibody titres at 4-week post-vaccination induced by ZOSTAVAX® administered by the IM route was similar (non-inferior) to that induced by ZOSTAVAX® administered by the SC route.</li> <li>The GMFR of the VZV gpELISA antibody titres from pre-vaccination to 4-week post-vaccination induced by ZOSTAVAX® administered by the IM route was acceptable (lower bound of its two-sided 95% CI was greater than 1.4).</li> <li>The GMC of VZV IFN-<math>\gamma</math> ELISPOT at 4-week post-vaccination and the GMFR of VZV IFN-<math>\gamma</math> ELISPOT from pre-vaccination to 4-week post-vaccination were comparable by IM and SC route.</li> <li>ZOSTAVAX® was generally well tolerated, either given by IM route or SC route and the safety profile of SC route group was comparable to the known safety profile. While systemic adverse events (overall and vaccine-related) were reported with comparable rates, the rates of injection-site reactions were lower in the group receiving the vaccine by IM route compared to the group receiving the vaccine by SC route. Statistically significant differences were identified for injection-site erythema, pain, swelling and pruritus.</li> </ul>
