Dear Sir/Madam,

Re: An assessment of the effects of pressors on graft blood flow after free tissue transfer surgery: A randomised study- Part II
Eudract Number: 2009-015533-79
REC Reference: 09/H0505/121

As a result of my early retirement from Oxford University Hospitals NHS Trust, the above study was placed on Temporary Halt after recruitment and completion of the study in only two patients. I have since taken up a Senior Lecturer post at the Eastman Dental Hospital, and with full support of the surgical and intensive care teams, we are very keen to complete this highly relevant study. The study is likely to result in improved post-operative care in patients undergoing not only free flap surgery but all forms of tissue transfer and transplantation.

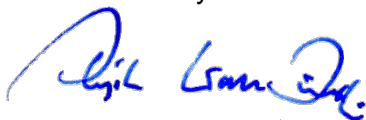

We would be grateful for the committees' approval to transfer sponsorship of the study to UCL.

Please find attached the submitted IRAS forms and letters from Oxford and UCL supporting the study transfer.

Many thanks for your help,

Kind regards,

Yours faithfully
