Title: Application of Daptomycin in MRSA infected diabetic foot in comparison to vancomycin treatment

The above-mentioned trial "Application of Daptomycin in MRSA infected diabetic foot in comparison to vancomycin treatment" was prematurely ended by the German competent authority with date 13-Mar-2012. Unfortunately, it was impossible to achieve the recruitment goal in a reasonable time. Only one patient was enrolled in the trial and treated with Daptomycin. In terms of outcome this treatment was successful within the per protocol planned timespan. No adverse events or SUSARs were to be reported for this patient.

Despite increased efforts no further patients were found to be eligible for the study. Thus, the decision to prematurely stop the trial was taken and made official in March 2012.

Due to this fact, no substantial results and conclusions can be drawn from this monocenter driven trial.
