STUDY: Optimization of procedural sedation protocol used for dental care delivery in people with mental disability (EudraCT 2013-3991-11)

This study, executed following the approved study protocol, was prematurely ended.

Reasons for this are twofold: (1) challenging recruitment of patients extending the inclusion period (two identical dental procedures needed for cross-over set-up); (2) organizational changes within the nursing care facility where the study took place (newly appointed physician attached to the nursing home and high turn-over of nursing staff). This lead to further delays in the recruitment and finally the decision to prematurely end the study.

Partial results of the study were included in a Master thesis, and made available.
