

EudraCT number: 2020-002186-34

Title: Efficacy of the early use of corticotherapy in CoV-2 infection to prevent the progression of acute respiratory distress syndrome (ARDS) in COVID-19

Code: MP_COVID19

Sponsor: Fundació Hospital Universitari Vall d'Hebron - Institut de Recerca (VHIR).

Principal Investigator: Dr Ferran Martínez-Valle

Justification of termination of the trial

The main goal of this study was to assess the impact of the administration of early corticosteroid on the evolution of ARDS pulses in patients with coronavirus-19 pneumonia (SARS-CoV-2) that causes mild respiratory distress.

Trial was not started by lack of recruitment. Since number of COVID-19 cases drastically dropped at the time of trial aperture, and there were already evidences in the use of corticosteroids in its treatment, trial was finally discontinued before reaching any result.
