

End-of-trial report

Study title: 'Metabolic MRI with hyperpolarized pyruvate in long-term COVID19 patients'
EudraCT: '2021-001031-72'

Status: Terminated before any participant was included

Reason:

We experienced significant issues in the production of hyperpolarized [1-¹³C]pyruvate from the Spring of 2021 to 2023. These issues did not prove easy to solve, and they were prolonged several times. As such, and considering the supposedly time-limited nature of the long-COVID19 study population, we have decided to end the present trial with no enrollment or results and focus on other opportunities for helping this group of patients.
