

Clinical trial results:

Effectiveness of Zometa treatment for the prevention of bone metastases in high risk prostate cancer patients. A randomized, open-label, multicenter study of the European Association of Urology (EAU) in Cooperation with the Scandinavian Prostate Cancer Group (SPCG) and the Arbeitsgemeinschaft Urologische Onkologie (AUO)

Summary

Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	17 January 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	17 January 2014
Global end of trial reached?	Yes
Global end of trial date	17 January 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to show superiority of zoledronic acid as compared to control in the proportion of patients with at least one bone metastasis after 48 months of treatment.

Protection of trial subjects:

Serum creatinine is to be measured prior to each dose of study drug.

Patients are advised, if possible, to avoid invasive dental procedures during the study.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 June 2004
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 70
Country: Number of subjects enrolled	Italy: 123
Country: Number of subjects enrolled	Belgium: 9
Country: Number of subjects enrolled	Switzerland: 15
Country: Number of subjects enrolled	Germany: 741
Country: Number of subjects enrolled	Denmark: 66
Country: Number of subjects enrolled	Finland: 86

Country: Number of subjects enrolled	Netherlands: 121
Country: Number of subjects enrolled	Norway: 45
Country: Number of subjects enrolled	Sweden: 27
Country: Number of subjects enrolled	Turkey: 27
Worldwide total number of subjects	1433
EEA total number of subjects	1391

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	507
From 65 to 84 years	913
85 years and over	13

Subject disposition

Recruitment

Recruitment details:

From June 2004 to August 2007, 1433 patients were randomized in 13 participating countries (Belgium, Switzerland, Germany, Denmark, Spain, Finland, France, Greece, Italy, The Netherlands, Norway, Sweden and Turkey).

Pre-assignment

Screening details:

Patients were screened to check whether they met the in- and exclusion criteria.

Period 1

Period 1 title	randomization period
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Zometa group

Arm description:

Zometa administered intravenously as a 15-minute infusion every 3 months for a treatment period of 48 months

Arm type	Active comparator
Investigational medicinal product name	zoledronic acid
Investigational medicinal product code	
Other name	Zometa
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Zoledronic acid was administered intravenously as a 15-minute infusion every 3 months for a treatment period of 48 months.

Patients were treated with Zometa 4 mg if at baseline the creatinine clearance was > 60 mL/min.

For patients with mild to moderate renal impairment (30 mL/min $<$ creatinine clearance ≤ 60 mL/min) at baseline the dose of Zometa was adjusted.

Zoledronic acid was provided in plastic vials containing 4 mg zoledronic acid in 5 mL concentrate solution for infusion. Each zoledronic acid plastic vial contained 4 mg zoledronic acid (anhydrous). The zoledronic acid 4 mg/5 mL concentrate solution was not for direct infusion and was further diluted prior to the use.

Arm title	Control group

Arm title	Control group
------------------	---------------

Arm description:

No investigational treatment

Arm type	No intervention
----------	-----------------

No investigational medicinal product assigned in this arm

Notes:

[1] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: treatment period (ITT population) is used, see also article.

Number of subjects in period 2^[2]	Zometa group	Control group
Started	694	699
Completed	440	477
Not completed	254	222
Adverse event, serious fatal	23	47
Consent withdrawn by subject	47	38
Physician decision	17	18
Adverse event, non-fatal	57	10
administrative problems	12	12
Lost to follow-up	21	26
Lack of efficacy	70	58
Protocol deviation	7	13

Notes:

[2] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: treatment period (ITT population) is used, see also article.

Primary: Paired bone imaging central review

End point title	Paired bone imaging central review
End point description: Bone imaging procedures were centrally reviewed after blinding. The possible outcomes of the central review were: non metastatic, metastatic, or equivocal. From 612 patients both baseline and follow-up bone imaging procedures were available for central review. The central reviewer indicated that 12 of 612 patients had bone metastases at baseline, and these were excluded.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
10 December 2003	Change in inclusion criterium; instead of only hormone naive patients, also patients receiving androgen deprivation therapy were allowed. The definition of abnormal renal function was changed. Change in bone turnover parameters.
10 February 2004	Originally, for the sample size calculation, an event rate in high risk prostate cancer patients not treated with Zometa of 25%, which was based on expert opinion, was assumed. However, with the adoption of new inclusion criteria a reduced proportion of events was expected and concerns were raised regarding the fact that the sample size calculation in the current study was based on a very large treatment effect of Zometa on time to symptomatic bone metastases and there was certainly a risk of the study being underpowered. Introduction of review of the safety data at 12 months from study starting, by an Independent Data Monitoring Committee.
08 June 2005	<p>During the Steering Committee that took place in Munich on March 31st 2004 it was decided to re-introduce the sub-study on bone mineral density, that was erroneously cancelled with the Amendment 1. Therefore, Amendment 4 re-introduced all the parts that were deleted with Amendment 1 as far as the sub-study on bone mineral density was concerned.</p> <p>Since in the original protocol no limitation of the time-window between two infusions of the experimental drug was reported, it was decided that the maximum time for Zometa discontinuation should be 16 weeks. Administration of the drug beyond 16 weeks after the last Zometa infusion would be considered as a major protocol deviation.</p> <p>Due to changes made, at that time, to Zometa prescribing information, an amendment to clinical study protocols with Zometa was required. These changes involved two areas:</p> <ul style="list-style-type: none">- Dose reduction for patients with renal impairment:- Osteonecrosis of the jaw (ONJ): <p>The instructions for rapid notification of serious adverse events were revised according to local internal procedure of Novartis subsidiaries of the countries involved in the trial.</p> <p>It was specified that the FDA form 1572 was not needed as one of the essential documents of the study. Therefore, the document was not collected anymore. Staging of Prostate Cancer in protocol Appendix 3 was replaced by the latest TNM Classification (American Joint Committee on Cancer, 2002).</p>

17 October 2006	<p>1) to introduce an expedited report in case of occurrence of osteonecrosis of the jaw (ONJ) and in cases of osteomyelitis.</p> <p>While ONJ was reported in cancer patients receiving bisphosphonates as a component of their therapy, the etiology and pathogenesis of ONJ are not clear. In order to better understand and assess ONJ, all cases of ONJ and osteomyelitis were to be expedited as 15-day reports.</p> <p>2) Planning of an interim analysis</p> <p>In the presence of strong evidence of treatment effect with Zometa in preventing bone metastases, the total study duration would be shortened.</p>
27 November 2009	<p>1) The change of the study statistician.</p> <p>2) The change of Steering Committee (SC) membership.</p> <p>3) The inclusion of a mandatory bone scan in ALL patients still on-study and a second interim analysis, as a consequence of the first interim analysis results.</p> <p>4) The inclusion of a blind central imaging review.</p>
08 December 2011	<p>During the Steering Committee and National Coordinators Meeting in March 2011, interim results relating to the development of bone metastases were evaluated. Analyses in December 2010 showed that 9% of patients developed bone metastases.</p> <p>At the end of the study (December 2011), when, at that time, looking at the status of patients who developed metastases, it was clear that it was unlikely that the 18% event rate as assumed in the protocol would be reached. With a prolonged follow up of another 2 years, it was very likely that we would have sufficient events for a powerful analysis.</p> <p>Therefore a 2 years longer follow up than anticipated originally in the protocol was proposed.</p> <p>During this period follow up information on the development of bone metastases and survival was collected yearly for each patient that was, at that time, followed for progression or survival in the ZEUS study. Only information on progression and survival was collected.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
