General information about the trial

Main objective of the trial:

To evaluate the safety of CC-5013 monotherapy in patients with advanced multiple myeloma who discontinued treatment with combination thalidomide plus high-dose dexamethasone or high-dose dexamethasone alone in studies Thal-MM-003, CC-5013-MM-009 and CC-5013-MM-010 due to the development of documented disease progression or the inability to tolerate the lowest dosing regimen per previous protocol of thalidomide and/or high-dose dexamethasone without Grade 3 or 4 toxicity.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization Good Clinical Practice Guidelines. All the local regulatory requirements pertinent to safety of trial participants were followed.

Primary: Number of Participants with Adverse Events (AE) During the Treatment Phase

End point title	Number of Participants with Adverse Events (AE) During the Treatment Phase[1]

End point description:

An AE is any sign, symptom, illness, or diagnosis (either observed or volunteered) that appears or worsens during the course of the study Serious adverse event (SAE) = any AE which results in death, is life-threatening, requires inpatient hospitalization or prolongation of existing hospitalization, results in persistent or significant disability/incapacity, is a congenital anomaly/birth defect; constitutes an important medical event. A treatment emergent AE is defined as any AE occurring or worsening on or after the first dose of study drug and within 30 days after the last dose of study drug. Safety and severity was assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events (NCI CTCAE) Version 2.0; Severity of AEs were graded (including second primary malignancies) as Grade 1- Mild; Grade 2- Moderate; Grade 3- Severe; Grade 4- Life-threatening; Grade 5-Fatal;

End point type	Primary

End point timeframe:

Until data cut-off date of of 22 Oct 2009; AEs/SAEs were recorded from informed consent to 30 days post treatment discontinuation visit; maximum exposure days on study drug was 1260 days

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
23 June 2003	1. The schedule of laboratory procedures was streamlined. 2. Protein electrophoresis and quantitative immunoglobulins were rescheduled to baseline, treatment discontinuation, and only if clinically indicated at all other visits. 3. Bone marrow aspiration/biopsy was rescheduled to baseline and only if clinically indicated thereafter. 4. Skeletal survey was rescheduled to baseline and to confirm complete response at discontinuation from treatment; thereafter, performed only if clinically indicated. 5. Immunofixation was rescheduled to baseline and only to confirm complete response thereafter.
09 June 2006	1. Clarified exclusionary hematology laboratory criteria. 2. Modified pregnancy language as stipulated in the RevAssist® program.
14 August 2006	1. Serum Beta-2 microglobulin added to Schedule of Study Assessments (screening). 2. Statement that "lenalidomide in combination with dexamethasone was also approved for the treatment of patients with multiple myeloma who have received at least one prior therapy" was added to the introduction.
16 June 2009	1. Enrollment into the study was terminated. 2. Subjects currently enrolled and receiving lenalidomide were given the opportunity to continue to receive lenalidomide from Celgene in the US and in other countries where this is possible without cost to the subject. 3. Subjects currently enrolled in Poland, Russia, and the Ukraine were given the opportunity to continue to receive lenalidomide via an extension phase and be monitored for safety.
