

Clinical trial results:

A multicentre randomised placebo-controlled double-blind clinical trial for evaluation of safety and efficacy of specific immunotherapy with an aluminium hydroxide-adsorbed Allergoid Preparation of house dust mite (*Dermatophagoides pteronyssinus*) in patients with allergic asthma bronchiale +/- rhinitis / rhinoconjunctivitis

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 September 2012
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	29 March 2011
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Evaluate efficacy and tolerability of specific immunotherapy (SIT) with an aluminium hydroxide-adsorbed allergoid preparation of the major allergens from *Dermatophagoides pteronyssinus* (D. pteronyssinus).

This trial was random., double-blind, placebo-contr. phase III, in 2 parallel groups of patients over 18 y of age; children and adolesc less than 18 y in the control group received UC with study-specific pharmacotherapy, instead of placebo.

Before randomisation to treatment, patient's minimal requirement of the inhaled corticosteroid dose to achieve asthma control was determined (patient diary, baseline). After randomisation to SIT, the study duration was 2 y for each patient (2 annual assessments).

After the analysis of the 2 y results, a decision was made to complete a full 3 year course of SIT in all actively treated patients (as recommended by the World Health Organisation) and do an open-label 3 y follow-up in children.

SIT=Specific Immunotherapy

UC=Usual Care

Protection of trial subjects:

The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki, and that are consistent with the International Conference on Harmonization of technical requirements for registration of pharmaceuticals for human use (ICH) guidance for Good Clinical Practice (GCP) and the applicable regulatory requirements. The study was conducted multinationally in accordance with the respective national legal requirements.

Children and adolescents under 18 years in the control group did not receive placebo, but instead received usual care with study-specific pharmacotherapy; 'usual care' consisted of a reliever and controller asthma medication.

Other than routine care, no specific measures were implemented for the protection of trial subjects.

Background therapy:

Treatment of asthma in this study was by an inhaled corticosteroid: fluticasone propionate 100 – 1000 µg per day in adults (50 – 500 µg per day in children) dry powder inhalation from a disk device. The corticosteroid dose was adjusted during the baseline phase at the beginning of the study and during assessment phases (15 September to 15 February each study year) until one dose step below the threshold dose of asthma control criteria (according to GINA) was met.

Acute symptomatic treatment of lower airways symptoms was with salbutamol metered dose inhaler (MDI; 100 µg per dose) used only as required. Other medication (including long acting-agonists, inhaled corticosteroids in the form of combination products was not permitted during the study.

Treatment of allergic rhinitis / rhinoconjunctivitis and other concomitant diseases was on the investigators' discretion. Long-term use of oral or other systemic corticosteroids (i.e. depot corticosteroids), immunoregulatory substances or medication that could influence the efficacy of SIT were exclusion criteria and their use was not permitted during the study.

If further treatments (i.e. oral corticosteroids) were required for the treatment of asthma exacerbations, these could be used; the duration of those therapies was to be kept as short as possible and their use documented.

DBP=Double Blind Phase
FU=Follow up Phase
GINA=Global Initiative for Asthma
MDI=Metered Dose Inhaler
OLP=Open Label Phase
SIT=Specific Immunotherapy

Evidence for comparator: -

Actual start date of recruitment	23 May 2005
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 23
Country: Number of subjects enrolled	Poland: 107
Worldwide total number of subjects	130
EEA total number of subjects	130

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	39
Adolescents (12-17 years)	27
Adults (18-64 years)	64
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Overall, 235 subjects [111 children and adolescents (2-17 y); 124 adults (18-64 y)] were screened for eligibility. Of these, 130 subjects (66 children and adolescents; 64 adults) were randomised to treatment, according to the exclusion and inclusion criteria.

Pre-assignment

Screening details:

Screened and randomised to treatment according to the exclusion and inclusion criteria.

Asthma was treated by inhaled Fluticasone propionate (FP); 100 - 1000 µg/day adults; 50 - 500 µg/day children, dry powder inhalation, disks. FP dose was adjusted during the baseline until 1 dose step below the threshold dose of asthma control criteria (GINA).

Period 1

Period 1 title	1_Double blind phase
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

Following a baseline assessment, all patients received either placebo (usual care in patients under 18 y) or the treatment allergoid preparation from D. pteronyssinus allergens for 2 years. This represents the double-blind, placebo-controlled treatment phase.

To minimise bias, different project leaders and monitors handled the 2 age groups of the study (adults and children), with a strict separation of information between these groups as well as between the participating centers

Arms

Are arms mutually exclusive?	Yes
Arm title	Children - Allergoid treatment (BDP)

Arm description:

Children randomised to allergoid treatment during the double-blind phase of the study.

Arm type	Experimental
Investigational medicinal product name	D. pteronyssinus allergoid preparation
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

House dust mite allergens were extracted from purified mite bodies (D. pteronyssinus) with buffered saline, partially purified by diafiltration, characterised, chemically modified by treatment with aldehydes and adsorbed onto aluminium hydroxide. The concentration was specified in PNU.

Two concentrations of the preparation were provided:

strength A: 300 PNU/mL being a 1:10 dilution of strength B (3000 PNU/mL).

The injections were administered slowly, strictly subcutaneously, under sterile precautionary measures, on the extensor side of the upper arm, a hand's breadth above the elbow, using a short-ground cannula. After each administration at the trial center, the patient was kept under close supervision for at least 30 minutes.

PNU=Protein nitrogen unit

Arm title	Children - Usual care (BDP)
------------------	-----------------------------

Arm description:

Children randomised to usual care during the double-blind phase of the study.

Arm type	Usual care in children, instead of placebo
Investigational medicinal product name	Usual care
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

Patients under 18 years of age at the time of enrollment who were randomised to control group did not receive a placebo preparation. Pharmacotherapy according to the study specific medication was used instead in the control group (usual care).

The 'usual care' consisted of a reliever and controller asthma medication.

Arm title	Adults - Allergoid treatment (BDP)
------------------	------------------------------------

Arm description:

Adults randomised to Allergoid treatment during the double-blind phase of the study..

Arm type	Experimental
Investigational medicinal product name	D. pteronyssinus allergoid preparation
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

House dust mite allergens were extracted from purified mite bodies (D. pteronyssinus) with buffered saline, partially purified by diafiltration, characterised, chemically modified by treatment with aldehydes and adsorbed onto aluminium hydroxide. The concentration was specified in PNU.

Two concentrations of the preparation were provided:

strength A: 300 PNU/mL being a 1:10 dilution of strength B (3000 PNU/mL).

The injections were administered slowly, strictly subcutaneously, under sterile precautionary measures, on the extensor side of the upper arm, a hand's breadth above the elbow, using a short-ground cannula. After each administration at the trial center, the patient was kept under close supervision for at least 30 minutes.

PNU=Protein nitrogen unit

Arm title	Adults - Placebo (DBP)
------------------	------------------------

Arm description:

Adults randomised to placebo during the double-blind phase of the study.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

A placebo solution was supplied as comparator for patients over 18 years of age, containing histamine-dihydrochloride (0.0125 mg/mL corresponding to strength A and 0.125 mg/mL corresponding to strength B) and caramel as a colouring agent, to ensure blinding by the physician and patient.

Placebo: solution containing aluminium hydroxide (Al(OH)₃) in normal saline (9 g/L sodium chloride) was applied.

For the injection volume and administration details of the placebo solution, please see the description above for the allergoid treatment arm.

Primary: 1_DBP_Minimum dose of inhaled corticosteroid to achieve asthma control, after 2 years of treatment

End point title	1_DBP_Minimum dose of inhaled corticosteroid to achieve asthma control, after 2 years of treatment
End point description: The minimum FP dose for asthma control according to GINA, was assessed before SIT therapy (baseline) and after the 2nd year of treatment, using predefined dose steps. Asthma control assessment (based on the nature and severity of asthma symptoms and the use of rescue medication) was based on patient diary entries: night-time awakenings; morning peak flow; daytime asthma symptoms; use of salbutamol rescue medication; exacerbations of asthma; emergency visits/unscheduled visits to the investigator due to asthma. Good asthma control was achieved if all of the following were fulfilled in each of the last 2 weeks of the 4 week diary phase: no night-time awakenings; no exacerbations; no emergency visit. FP dose: Children=50 to 500 µg/day, Adults=100 to 1000 µg/day FP dose steps: 1=50µg; 2=100µg; 3=250µg; 4=500µg; 5=1000µg. Results represent the change in minimum asthma control dose of FP in children/adults, as dose steps; scale -4 to +3. FP=Fluticasone propionate	
End point type	Primary

End point timeframe:

Assessment period of approx. 6 months before treatment (baseline assessment) and after 2 years of double-blind treatment.

End point description:

Changes from baseline in the asthma control parameters.

The following items were documented daily for 4 to 5 periods of 4 weeks during each diary phase: 1) night-time awakenings; 2) morning PEF <80% of predicted normal; 3) daytime cough/dry cough; 4) daytime chest tightness; 5) daytime wheeze; 6) daytime dyspnoea; 7) asthma control phases with asthma summary score > 1; 8) use of salbutamol rescue medication; 9) exacerbations of asthma; 10) emergency visits/unscheduled visits to the investigator due to asthma.

Note: No relevant differences were seen between allergoid preparation and comparator in any of the evaluated items or age group, after 1 year or 2 years of treatment.

Thus, only a representative entry of data is made for the item: all asthma symptoms. Data are shown

as the difference between the baseline and the end of treatment (after 2 years of double-blind treatment phase).

End point type	Secondary

From the start of the study (signing of the informed consent) until the end of the study (last study visit i.e. 2 years after study start for open-label phase, and 3 years for the follow-up phase).

Adverse event reporting additional description:

Some AEs were reported during the 'bridging' phase of the study. This phase occurred between the 'blind-label' phase and 'open-label' phase, when no treatment was given. AEs that were reported during the 'bridging' phase were included in the 'blind-label' phase.

Assessment type	Systematic

Reporting groups

Reporting group title	Screening/Baseline: Children - Allergoid treatment
-----------------------	----------------------------------------------------

Reporting group description:

Children during the screening/baseline phase of the study, randomised to Allergoid treatment group.

Reporting group title	Screening/Baseline: Children - Usual care
-----------------------	-------------------------------------------

Reporting group description:

Children during the screening/baseline phase of the study, randomised to 'usual care' treatment group.

Reporting group title	Screening/Baseline: Adults - Allergoid treatment
-----------------------	--------------------------------------------------

Reporting group description:

Adults during the screening/baseline phase of the study, randomised to Allergoid treatment group.

Reporting group title	Screening/Baseline: Adults - Placebo
-----------------------	--------------------------------------

Reporting group description:

Adults during the screening/baseline phase of the study, randomised to placebo treatment group.

Reporting group title	DBP: Children - Allergoid treatment
-----------------------	-------------------------------------

Reporting group description:

Children randomised to allergoid treatment, during the double-blind treatment phase.

Reporting group title	DBP: Children - Usual care
-----------------------	----------------------------

Reporting group description:

Children randomised to usual care, during the double-blind treatment phase..

Reporting group title	DBP: Adults - Allergoid treatment
-----------------------	-----------------------------------

Reporting group description:

Adults randomised to Allergoid treatment, during the double-blind treatment phase.

Reporting group title	DBP: Adults - Placebo
-----------------------	-----------------------

Reporting group description:

Adults randomised to placebo, during the double-blind treatment phase.

Reporting group title	OLP: Children - Allergoid treatment
-----------------------	-------------------------------------

Reporting group description:

Children receiving Allergoid treatment during the open-label phase (OLP).

Reporting group title	OLP: Adults - Allergoid treatment
-----------------------	-----------------------------------

Reporting group description:

Adults receiving Allergoid treatment during the open-label phase (OLP).

Reporting group title	FU: Children - Allergoid treatment
-----------------------	------------------------------------

Reporting group description:

Children receiving Allergoid treatment during the follow-up phase (FU).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
25 February 2005	<p>Non-substantial amendment: Administrative and operative amendments.</p> <ul style="list-style-type: none">• A second project manager responsible for the open investigation in patients < 18 years of age was appointed, and a Blind Data Review Board was established.• To ensure confidentiality of information gained in the open part of this study from the double-blind investigation in adults, regulations pertaining to the separation of both study parts were established.• The randomisation procedure and the number of (randomised) patients per center were clarified.• For patients who received other than the permitted asthma medication, the assessment of medication for efficacy analysis was defined.• Two repeats of house dust sampling for the determination of house dust mite allergens were made obligatory.• The method (chi-squared test) of group comparison in case of only few steps of changes from baseline was added.• For the assessment of the primary endpoint (asthma control), the data from the last two weeks of every 4-week diary had to be available. The randomisation procedure and the number of (randomised) patients per center had to be available.
04 May 2005	<p>Non-substantial amendment: Administrative and operative amendment.</p> <p>Adjust study administrative items.</p>
30 August 2005	<p>Substantial amendment Adjust study procedures in the study protocol:</p> <ul style="list-style-type: none">• Omit the determination of unspecific bronchial provocation testing and nitric oxide determination in exhaled air at screening.• While recording the lung function data during the assessment phases of the study, also include the assessment of MEF25, 50, and 75 (MEF25, MEF50, MEF75= maximal expiratory flow at 25% – 50% – 75% of vital capacity).

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
