Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	22 January 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	22 January 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Determine the sixteen (16) week progression-free survival (PFS) rate for Neratinib (HKI-272) in women with advanced breast cancer.

Protection of trial subjects:

The protocol, the investigator's brochure (IB), and the informed consent form (ICF) for this clinical study were submitted to an institutional review board (IRB) or an independent ethics committee (IEC) for review and written approval. Any subsequent amendments to the protocol or any revisions to the ICF were submitted for IRB or IEC review and written approval. This study was conducted in accordance with the International Conference on Harmonisation (ICH) Guideline for Good Clinical Practice (GCP) and the ethical principles that have their origins in the Declaration of Helsinki. All investigators have provided written commitments to comply with GCP standards and the protocol.

Clinical trial data were monitored at regular intervals by the Sponsor or their representative throughout the study to verify compliance to study protocol, completeness, accuracy and consistency of the data and adherence to local regulations on the conduct of clinical research.

Neratinib administration was stopped in subjects if neratinib was not well tolerated, if subjects had documented disease progression, if subjects had clinical evidence of congestive heart failure (CHF) requiring medical intervention, if subjects had a decrease in LVEF of ≥ 25 points from baseline if the LVEF remained in the range of ≥ 50 points, or a decrease in LVEF of ≥ 10 points from baseline to a final LVEF value < 50 points, if pregnancy was confirmed, if a need was determined for initiation of bisphosphonates or palliative radiation therapy, including whole-brain irradiation for documented CNS disease, if subjects were on any of the prohibited concomitant therapies of the protocol, if dose administration was delayed for more than 3 weeks, if subjects needed more than 2 dose reductions because of toxicity.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 August 2006
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 24
Country: Number of subjects enrolled	China: 28
Country: Number of subjects enrolled	India: 28
Country: Number of subjects enrolled	Mexico: 5
Country: Number of subjects enrolled	Russian Federation: 10
Country: Number of subjects enrolled	United States: 41

Worldwide total number of subjects	136
EEA total number of subjects	24

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	123
From 65 to 84 years	13
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Subjects who satisfied the all inclusion criteria were eligible to participate in this study if none of the exclusion criteria were met.

Period 1

Period 1 title	Treatment (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	NER240, w prior HER2 tx

Arm description:

Neratinib 240 mg qd, for HER2+ patients who have received prior Trastuzumab or HER2 treatment. Arm enrolled women with HER2-positive breast cancer and erbB2 gene amplification confirmed in tumor tissue; and disease progression during or after trastuzumab-containing adjuvant therapy, or following at least 6 weeks of standard doses of trastuzumab in a metastatic or locally advanced setting

Arm type	Experimental
Investigational medicinal product name	Neratinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Neratinib was supplied to the investigative sites as 80-mg capsules and was administered in daily oral doses of 240 mg with food, preferably in the morning.

Arm title	NER240, w/o prior HER2 tx
------------------	---------------------------

Arm description:

Neratinib 240 mg qd, HER2+ and no prior Trastuzumab or HER2 treatment. Women with HER2-positive breast cancer and erbB2 gene amplification confirmed in tumor tissue and no prior trastuzumab or other erbB2-targeted treatment. Enrollment in this was not applicable to subjects from France who enrolled in the study because the country's ethics committee did not approve of the enrollment of trastuzumab-naïve subjects in the study.

Arm type	Experimental
Investigational medicinal product name	Neratinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Neratinib was supplied to the investigative sites as 80-mg capsules and was administered in daily oral doses of 240 mg with food, preferably in the morning.

Number of subjects in period 1	NER240, w prior HER2 tx	NER240, w/o prior HER2 tx
Started	66	70

Women with HER2-positive breast cancer and erbB2 gene amplification confirmed in tumor tissue and no prior trastuzumab or other erbB2-targeted treatment. Enrollment in this was not applicable to subjects from France who enrolled in the study because the country's ethics committee did not approve of the enrollment of trastuzumab-naïve subjects in the study.	

Primary: 16-week Progression Free Survival Rate - Independent Assessment

End point title	16-week Progression Free Survival Rate - Independent Assessment ^[1]
End point description: The proportion of subjects who were alive and progression free 16 weeks after the first dose of neratinib. The 16-week PFS rate was estimated using the Kaplan Meier method. Subjects for whom disease progression or death was not observed were censored at the date of their last tumor assessment. The determination of progression was made by an independent radiologist. The primary efficacy endpoint was analyzed separately for the 2 treatment arms. For this study, the null hypothesis was an uninteresting 16-week PFS rate of 30% or less for each treatment arm. The alternative hypothesis, the sufficiently promising rate, was set at 50%. The proportion and corresponding 90% and 95% CI of subjects who were progression free and surviving at 16 weeks were estimated.	
End point type	Primary
End point timeframe: From first dose of Neratinib through 16 weeks	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The primary efficacy endpoint of PFS at 16 weeks was analyzed separately for each baseline trastuzumab status arm with no comparison between the arms. The proportion and corresponding 95% CI were estimated using the Kaplan-Meier method.

Secondary: Best Overall Response, Independent Assessment

End point title	Best Overall Response, Independent Assessment
End point description:	
The best tumor response is the best response, according to RECIST, recorded from the first dose of study drug until disease progression and/or recurrence (taking as reference for PD the smallest measurements previously). To be assigned a best tumor response of CR or PR, the initial assessment must be confirmed by repeat evaluations that should be performed no less than 4 weeks later. The response is assessed by a independent radiologist, for evaluable population. The evaluable population was defined as all subjects who met the eligibility criteria, received at least 1 week of neratinib, and had at least 1 follow-up tumor assessment after receiving the first dose of neratinib.	
End point type	Secondary
End point timeframe:	
From First Dose of Neratinib through disease progression or recurrence.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 April 2006	This amendment included updates to staffing information, starting dose of neratinib (changed from 320 mg to 240 mg), Phase 1 safety information, and Sponsor team contact information.
30 November 2006	This amendment included updates to Sponsor's contacts, addition of study synopsis, removal of pharmacogenomics optional sampling, removal of month 1 week 4 tumor assessment, change to eligibility with regard to use of adjuvant trastuzumab, allowance of enrollment of up to 20 subjects with prior lapatinib treatment, modified recommended dose adjustment for Adverse Events of Diarrhea Grade 2 or 3 last >2 days on medical therapy or associated with fever or dehydration and related to neratinib, clarification of RECIST criteria and target lesions considered too small to measure, and inclusion of definition of medication errors.
19 January 2010	This amendment included additional blood chemistry and coagulation testing for patients with signs or symptoms of hepatic injury, guidelines to provide dose adjustment, guidelines in the event of hepatic toxicity, corrected the definition of time to tumor progression, removed of all language added for Brazil-specific amendments, and administrative changes to study team personnel and contact information.
25 February 2010	This amendment included addition of treatment extension period, which allowed patients who still derived benefit from study participation to remain on the study and enabled the Sponsor (Pfizer) to continue to provide investigational product (IP) to the patients after the primary objectives had been reached. During the treatment extension period, the required procedures were limited to IP administration and monitoring for safety and tolerability; adverse events (AEs) and serious adverse events (SAEs) were to be documented and the data sent to the Sponsor. To limit the patient's burden in terms of protocol-required efficacy assessments, tumor assessment was to be performed as clinically indicated at the Investigator's discretion according to standard of care; however, no efficacy data were collected.
22 March 2012	This amendment documented the change in sponsorship from Pfizer to Puma and further reduced the data collection requirements.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats
