

## Clinical trial results:

### An Open-label, Non-Comparative Trial to Evaluate the Safety, Efficacy and Pharmacokinetics of FASLODEX™ (fulvestrant) in Girls with Progressive Precocious Puberty Associated with McCune-Albright Syndrome

#### Summary

EudraCT number	2005-004893-26
Trial protocol	GB ES DE IT
Global end of trial date	20 July 2023

#### Results information

Result version number	v2 (current)
This version publication date	20 March 2024
First version publication date	07 January 2024
Version creation reason	

#### Trial information

##### Trial identification

Sponsor protocol code	D6992C00044
-----------------------	-------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT00278915
WHO universal trial number (UTN)	-

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	03 September 2010
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	20 July 2023
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The primary objectives of the study included:

1. Safety component: The safety of study treatment will be evaluated by assessments of adverse events, withdrawals, laboratory data, ovarian volume as assessed by ultrasound, including the number of ovarian cysts and size of the largest cyst, and uterine volume.
2. Efficacy component: The efficacy of study treatment will be based on change in frequency of vaginal bleeding days, rate of increase in bone age, and growth rate.
3. Pharmacokinetics (PK) component: PK of fulvestrant in girls with progressive precocious puberty (PPP) associated with McCune-Albright syndrome (MAS).

Protection of trial subjects:

The conduct of this clinical study met all local and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and are consistent with International Conference on Harmonization guideline: Good Clinical Practice, and applicable regulatory requirements. Participants signed an informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	31 January 2006
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	5 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	France: 5
Country: Number of subjects enrolled	Germany: 3
Country: Number of subjects enrolled	Italy: 3
Country: Number of subjects enrolled	Russian Federation: 4
Country: Number of subjects enrolled	United Kingdom: 6
Country: Number of subjects enrolled	United States: 9
Worldwide total number of subjects	30
EEA total number of subjects	11

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	30
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at study sites located in France, Germany, Italy, Russian Federation, United Kingdom, and the United States of America.

### Pre-assignment

Screening details:

A total of 30 participants were enrolled in this study.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

### Arms

Arm title	Fulvestrant
-----------	-------------

Arm description:

Participants received intramuscular injection of fulvestrant 2 mg/kg or 4 mg/kg (First 10 participants were dosed at 2 mg/kg then increased to 4 mg/kg. All subsequent participants were dosed at 4 mg/kg) into the buttock or thigh monthly for 12 months or until the participant demonstrates lack of efficacy based upon one or more of the primary endpoints or experiences a serious drug-related toxicity requiring treatment discontinuation.

Arm type	Experimental
Investigational medicinal product name	Fulvestrant
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Participants received intramuscular injection of fulvestrant 2 mg/kg or 4 mg/kg (First 10 participants were dosed at 2 mg/kg then increased to 4 mg/kg. All subsequent participants were dosed at 4 mg/kg) into the buttock or thigh monthly for 12 months or until the participant demonstrates lack of efficacy based upon one or more of the primary endpoints or experiences a serious drug-related toxicity requiring treatment discontinuation.

Number of subjects in period 1	Fulvestrant
Started	30
Completed	29
Not completed	1
Disease progression	1

## Baseline characteristics

### Reporting groups

Reporting group title	Fulvestrant
-----------------------	-------------

Reporting group description:

Participants received intramuscular injection of fulvestrant 2 mg/kg or 4 mg/kg (First 10 participants were dosed at 2 mg/kg then increased to 4 mg/kg. All subsequent participants were dosed at 4 mg/kg) into the buttock or thigh monthly for 12 months or until the participant demonstrates lack of efficacy based upon one or more of the primary endpoints or experiences a serious drug-related toxicity requiring treatment discontinuation.

Reporting group values	Fulvestrant	Total

## End points

### End points reporting groups

Reporting group title	Fulvestrant
Reporting group description:	
Participants received intramuscular injection of fulvestrant 2 mg/kg or 4 mg/kg (First 10 participants were dosed at 2 mg/kg then increased to 4 mg/kg. All subsequent participants were dosed at 4 mg/kg) into the buttock or thigh monthly for 12 months or until the participant demonstrates lack of efficacy based upon one or more of the primary endpoints or experiences a serious drug-related toxicity requiring treatment discontinuation.	

### Primary: Change in Frequency of Annualised Days of Vaginal Bleeding on Treatment Compared to Baseline

End point title	Change in Frequency of Annualised Days of Vaginal Bleeding on Treatment Compared to Baseline <sup>[1]</sup>
-----------------	-------------------------------------------------------------------------------------------------------------

End point description:

Vaginal bleeding days are defined as the number of days in which vaginal bleeding, (including spotting) occurred. In order to annualise, a 12 month period is defined as 360 days and a 6 month period is defined as 180 days. Frequency of annualised vaginal bleeding days = [(number of vaginal bleeding days)/(total number of days of the time interval under consideration)] multiplied by 360. Change in frequency is equal to the on treatment frequency minus the baseline frequency. Diary cards will capture days of vaginal bleeding during the 12-month treatment period. Change in the frequency of annualised days of vaginal bleeding during the 12 month treatment period compared to the 6 month baseline period, based on a worst-case scenario calculation (ie, missing diary card days counted as bleeding days) are reported. The full-analysis set (FAS) population included participants who received at least 1 dose of study drug.

End point type	Primary
----------------	---------

End point timeframe:

Baseline (6 month pre-treatment observation period) through Month 12 treatment period

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Statistical analysis was not applicable since there were no inferential statistics, only descriptive statistics were performed for this end point.

<b>End point values</b>	Fulvestrant			
Subject group type	Reporting group			
Number of subjects analysed	30			
Units: Days per year				
median (full range (min-max))	-3.6 (-42 to 185)			

### Statistical analyses

No statistical analyses for this end point

### Primary: Percentage of Participants With Baseline Vaginal Bleeding Who Experienced $\geq 50\%$ Reduction in the Number of Vaginal Bleeding Days on Treatment Compared to Baseline

End point title	Percentage of Participants With Baseline Vaginal Bleeding Who Experienced $\geq 50\%$ Reduction in the Number of Vaginal Bleeding Days on Treatment Compared to Baseline <sup>[2]</sup>
-----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

End point description:

The percentage change in frequency is defined as 100% times the difference (the on-treatment period frequency minus the baseline period frequency), divided by the baseline period frequency. The percentage of participants with baseline vaginal bleeding days who experienced  $\geq 50\%$  reduction in the number of vaginal bleeding days during the 12 month treatment period compared to the 6 month baseline period based on a worst-case approach (ie, missing diary card days counted as bleeding days) are reported. The FAS population included participants who received at least 1 dose of study drug. Here, number of subjects analyzed denotes those participants who had bleeding during the 6 month baseline period.

End point type	Primary

### Primary: Change in Rate of Bone Age (BA) Advancement Over First 6-month Treatment Period Compared to Baseline

End point title	Change in Rate of Bone Age (BA) Advancement Over First 6-month Treatment Period Compared to Baseline <sup>[5]</sup>
-----------------	---------------------------------------------------------------------------------------------------------------------

End point description:

Change in rate of BA advancement over first 6-month treatment period compared to baseline (6 month pre-treatment observation period) is reported. Increase in BA is defined as BA (expressed as fractional years) at end of time period minus BA at beginning of time period (unit: years). Rate of increase in BA

for a particular time interval is increase in BA during this time interval adjusted (ie, normalized) for the length of this time interval. Rate of BA advancement is change in BA (years) divided by change in chronological age (CA) (years). Change in rate of increase in BA from baseline period to on-treatment period is defined as increase in BA divided by change in CA (in fractional years) between BA radiograph dates. It is calculated as  $[(BA_6 - BA_0)/(CA_6 - CA_0)] - [(BA_0 - BA^*)/(CA_0 - CA^*)]$ , where 6, 0, \* stands for first Month 6 Visit, Month 0 Visit, and the 6 month retrospective visit, respectively. The FAS population included participants who received at least 1 dose of study drug.

End point type	Primary

### Primary: Change in Mean Ovarian Volume From Baseline to Month 6 as Assessed by Ultrasound

End point title	Change in Mean Ovarian Volume From Baseline to Month 6 as Assessed by Ultrasound <sup>[14]</sup>
-----------------	--------------------------------------------------------------------------------------------------

#### End point description:

The mean ovarian volume was the average of both ovaries. Average volume was calculated as 0.5 multiplied by (volume of left ovary plus volume of right ovary) if both volumes were calculated; otherwise, average ovarian volume was considered missing. The volume of each ovary was calculated via ultrasound using the formula: 0.5 multiplied by longitudinal dimension multiplied by anterior-posterior dimension multiplied by transverse dimension. Change in mean ovarian volume from baseline to Month 6 was calculated as Month 6 mean volume minus Screening Visit mean volume. Baseline (screening visit) is the pre-treatment baseline visit. The FAS population included participants who

received at least 1 dose of study drug. Here, number of subjects analyzed denotes those participants with data at both time points.

End point type	Primary
----------------	---------

End point timeframe:

Baseline (pre-treatment screening visit) and Month 6 of treatment period

## Primary: Change in Uterine Volume From Baseline to Month 12/Final Visit as Assessed by Ultrasound

End point title	Change in Uterine Volume From Baseline to Month 12/Final Visit as Assessed by Ultrasound <sup>[15]</sup>
-----------------	----------------------------------------------------------------------------------------------------------

End point description:

Uterine volume was calculated via ultrasound using the formula: 0.5 multiplied by (longitudinal multiplied by anteroposterior multiplied by transverse), if all 3 linear dimensions were recorded. If all 3 linear dimensions were not recorded, uterine volume was not calculated. Change in uterine volume from baseline to Month 12/final visit was calculated as End of Study volume (by ultrasound) minus Screening Visit volume (by ultrasound). Baseline (screening visit) is the pre-treatment baseline visit. The FAS population included participants who received at least 1 dose of study drug. Here, number of subjects analyzed denotes those participants with data at both time points.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 March 2008	Various sections throughout the original Clinical Study Protocol (CSP): Text revised to reflect the fact that separate consent was not required for the Five-Year Safety Surveillance period. Text revised to clarify that first month blood samples were only required for the first 6 participants. The collection period for steady state samples was revised to include Month 10, 11 and 12. Text in Sections 3.4.1.1 and 3.4.2 revised to clarify syringes provided in the Unites States and Rest of World. Text in Section 3.4.2 also revised to indicate that injection could be given in the buttock or thigh. Section 4.2, Screening and demographic measurements; text removed to make it clear that retrospective data was available for some participants prior to written informed consent. Various sections throughout the original CSP: Text revised for to clarify that full physical exams, including Tanner stage, were performed at Month 0, 3, 6 and 12 only. Height and weight were collected at each study visit. Text added to indicate that for Months 0 to 12, radiographs were read both locally and centrally. In the extension period only, local radiographs were collected. Additional text added to indicate that a telephone visit or participant office visit was required 60 days following the last injection of study drug to collect any post treatment AEs. Text was added to clarify that the genetic specimens will be analyzed at an independent institute. Section 5, Data management: text edited to include the possibility that case report forms would be sent to an AstraZeneca designee.

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Data for exploration on body weight and race effect on fulvestrant PK is not available due to small sample size. Data for number and size of ovarian cysts at different time-point were too sparse to produce a meaningful summary, hence not reported.

Notes:
