

## Clinical trial results:

### Open, Randomised, Comparative, Multicentre Study of the Immunogenicity and Safety of Concomitant versus Separate administration of a combined measles, mumps, rubella and varicella live vaccine (ProQuad®) and a Booster dose of Infanrix® hexa in Healthy Children 12 to 23 months of age

#### Summary

EudraCT number	2006-004129-27
Trial protocol	DE IT
Global end of trial date	27 March 2008

#### Results information

Result version number	v1 (current)
This version publication date	27 April 2016
First version publication date	22 July 2015

#### Trial information

##### Trial identification

Sponsor protocol code	X06-MMRV-302
-----------------------	--------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT00432042
WHO universal trial number (UTN)	-

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 March 2008
Is this the analysis of the primary completion data?	Yes
Primary completion date	27 March 2008
Global end of trial reached?	Yes
Global end of trial date	27 March 2008
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To demonstrate that ProQuad® can be administered concomitantly with a booster dose of Infanrix® hexa to healthy children of 12 to 23 months of age without impairing neither the antibody response rates to measles, mumps, rubella, varicella, hepatitis B, and Haemophilus influenzae type b, or to the 3 pertussis antibody titres measured at 42 days following vaccination.

Protection of trial subjects:

Healthy subjects with prior known sensitivity/allergy to any component of the vaccine including neomycin, sorbitol or gelatine were excluded.

Vaccines were administered by qualified study personnel.

After each vaccination, subjects were kept under observation for at least 20 minutes to ensure their safety.

Appropriate medical treatment and supervision were always readily available in case of a rare anaphylactic reaction following the administration of the vaccine.

Background therapy:

# For Italy, primary vaccination with the combined diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis, and Haemophilus influenzae type b vaccine Infanrix hexa as a 2-dose schedule, with receipt of the 2nd dose  $\geq 6$  months prior to inclusion.

# For Germany, primary vaccination with the combined diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis, and Haemophilus influenzae type b vaccine Infanrix hexa as a 3-dose schedule, with receipt of the 3rd dose  $\geq 6$  months prior to inclusion.

Evidence for comparator:

The immunisation schedule of hexavalent vaccines consists of a primary series followed by a booster dose given at the same age as ProQuad. The rationale of the study was to generate immunogenicity and safety data for ProQuad when administered concomitantly either with the 3rd dose of Infanrix hexa (Italian schedule) or with the 4th dose of Infanrix hexa (German schedule) given in the 2nd year of life. Therefore, concomitant administration of ProQuad and Infanrix hexa was compared to administration of each of these vaccines alone.

Actual start date of recruitment	12 January 2007
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 728
Country: Number of subjects enrolled	Italy: 227
Worldwide total number of subjects	955
EEA total number of subjects	955

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	954
Children (2-11 years)	1
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Study subjects were enrolled between 12 January 2007 and 13 February 2008 in 51 active centres: 6 vaccination centres in Italy, and 45 private paediatricians in Germany.

### Pre-assignment

Screening details:

963 subjects were screened.

955 subjects were randomised (14 subjects randomised in 1 centre in Germany were excluded from analyses due to a major Good Clinical Practice (GCP) non compliance (non reliability of vaccination history)).

952 subjects received at least 1 vaccine dose.

945 subjects completed the study.

### Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Not applicable as this study was open-label.

For immunogenicity data, serology tests were performed by laboratory staffs who were blinded to which vaccine each subject received.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Group 1: ProQuad + Infanrix hexa

Arm description:

# Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route concomitantly with Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age.

# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.

Arm type	Experimental
Investigational medicinal product name	ProQuad®
Investigational medicinal product code	MMRV
Other name	ProQuad
Pharmaceutical forms	Powder and solvent for suspension for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

0.5 mL, subcutaneous route (deltoid region), 1 dose at 12-23 months of age.

ProQuad had to be administered in the contralateral arm than the one for Infanrix hexa.

Investigational medicinal product name	Infanrix® hexa
Investigational medicinal product code	DTaP-HBs-IPV//Hib
Other name	Infanrix hexa
Pharmaceutical forms	Powder and suspension for suspension for injection
Routes of administration	Intramuscular use

Dosage and administration details:

0.5 mL, intramuscular route (deltoid region), 1 dose at 12-23 months of age.

Infanrix hexa had to be administered in the contralateral arm than the one for ProQuad.

<b>Arm title</b>	Group 2: ProQuad
------------------	------------------

**Arm description:**

# Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route at 12-23 months of age.

# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.

Arm type	Active comparator
Investigational medicinal product name	ProQuad®
Investigational medicinal product code	MMRV
Other name	ProQuad
Pharmaceutical forms	Powder and solvent for suspension for injection
Routes of administration	Subcutaneous use

**Dosage and administration details:**

0.5 mL, subcutaneous route (deltoid region), 1 dose at 12-23 months of age.

<b>Arm title</b>	Group 3: Infanrix hexa
------------------	------------------------

**Arm description:**

# Subjects received Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age.

# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.

Arm type	Active comparator
Investigational medicinal product name	Infanrix® hexa
Investigational medicinal product code	DTaP-HBs-IPV//Hib
Other name	Infanrix hexa
Pharmaceutical forms	Powder and suspension for suspension for injection
Routes of administration	Intramuscular use

**Dosage and administration details:**

0.5 mL, intramuscular route (deltoid region), 1 dose at 12-23 months of age.

<b>Number of subjects in period 1</b>	Group 1: ProQuad + Infanrix hexa	Group 2: ProQuad	Group 3: Infanrix hexa
Started	479	235	241
Completed	472	234	239
Not completed	7	1	2
Personal reason	-	-	2
Lost to follow-up	5	1	-
Protocol deviation	2	-	-

## Baseline characteristics

### Reporting groups

Reporting group title	Group 1: ProQuad + Infanrix hexa
Reporting group description:	
# Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route concomitantly with Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age.	
# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	
Reporting group title	Group 2: ProQuad
Reporting group description:	
# Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route at 12-23 months of age.	
# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	
Reporting group title	Group 3: Infanrix hexa
Reporting group description:	
# Subjects received Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age.	
# Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	

Reporting group values	Group 1: ProQuad + Infanrix hexa	Group 2: ProQuad	Group 3: Infanrix hexa

## End points

### End points reporting groups

Reporting group title	Group 1: ProQuad + Infanrix hexa
Reporting group description: # Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route concomitantly with Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age. # Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	
Reporting group title	Group 2: ProQuad
Reporting group description: # Subjects received ProQuad (measles, mumps, rubella and varicella (live attenuated)) vaccine dose 1 by subcutaneous route at 12-23 months of age. # Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	
Reporting group title	Group 3: Infanrix hexa
Reporting group description: # Subjects received Infanrix hexa (DTaP-HBV-IPV-Hib = Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated), and Haemophilus influenzae type b conjugate vaccine (adsorbed)) booster dose by intramuscular route at 12-23 months of age. # Subjects were blood sampled at (i) Day -7 (D-7) to D0 before vaccination = pre-vaccination, and (ii) 6 weeks (D42 to D56) after vaccination = post-vaccination.	

### Primary: Antibody (Ab) response rates to Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2)

End point title	Antibody (Ab) response rates to Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2) <sup>[1]</sup>
End point description: Percentage of subjects with an Ab titre $\geq 255$ mIU/mL for Measles, $\geq 10$ ELISA Ab units/mL for Mumps, $\geq 10$ IU/mL for Rubella, and $\geq 5$ gpELISA units/mL for Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose. All Ab titres were measured by Enzyme-Linked Immunosorbent Assay (ELISA), except Ab to Varicella determined by glycoprotein ELISA (gpELISA). Analysis was done on the Antigen-Specific Per Protocol Set (PPS), i.e. all randomised subjects initially seronegative for those antigens (Measles Ab titre $< 255$ mIU/mL, Mumps Ab titre $< 10$ ELISA Ab units/mL, Rubella Ab titre $< 10$ IU/mL, and Varicella Ab titre $< 1.25$ gpELISA units/mL) excluding subjects with protocol violations which may interfere with the immunogenicity evaluation. Note: (N=***, ***) represents the number of assessed subjects in the "ProQuad + Infanrix hexa" and "ProQuad" groups, respectively.	
End point type	Primary
End point timeframe: 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose.	

#### Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.  
Justification: The objective of this endpoint was to evaluate the antibody response rates to Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose. So this endpoint did not concern subjects of the "Infanrix hexa" arm.

End point values	Group 1: ProQuad + Infanrix hexa	Group 2: ProQuad		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	431	215		
Units: Percentage of subjects				
number (confidence interval 95%)				
Anti-Measles $\geq 255$ mIU/mL (N=421, 215)	97.4 (95.4 to 98.7)	96.3 (92.8 to 98.4)		
Anti-Mumps $\geq 10$ ELISA Ab units/mL (N=427, 212)	96.7 (94.6 to 98.2)	98.6 (95.9 to 99.7)		
Anti-Rubella $\geq 10$ IU/mL (N=431, 215)	97.9 (96.1 to 99)	99.1 (96.7 to 99.9)		
Anti-Varicella $\geq 5$ gpELISA units/mL (N=394, 205)	97.7 (95.7 to 99)	95.1 (91.2 to 97.6)		

## Statistical analyses

Statistical analysis title	Non-inferiority for Measles
Statistical analysis description:

----------------------------	------------------------

Statistical analysis description:

The estimates of the post-vaccination GMT ratios Group 1 (ProQuad + Infanrix hexa) / Group 3 (Infanrix hexa) were calculated with their 2-sided 95% confidence interval (CI) and adjusted for pre-vaccination titres, Infanrix hexa primary vaccination & region. If the lower bounds of the 95% CI were greater than the non-inferiority margin, it was concluded that Group 1 GMT were non-inferior to Group 3 GMT. Analysis was done on the PPS.

Comparison groups	Group 3: Infanrix hexa v Group 1: ProQuad + Infanrix hexa
Number of subjects included in analysis	597
Analysis specification	Pre-specified
Analysis type	non-inferiority <sup>[10]</sup>
Parameter estimate	GMT ratio
Point estimate	0.97
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.88
upper limit	1.08

Notes:

[10] - For PT: # PPS, N=379, 209 (Groups 1 & 3) # Non-inferiority margin, 0.5.

Statistical analysis was based on an ANCOVA model with the log-transformed post-vaccination titres as response, the log-transformed baseline titres as covariate, the Infanrix hexa primary vaccination, the Region (nested effect) and the Group as fixed effects.

Statistical analysis title	Non-inferiority for FHA
----------------------------	-------------------------

Notes:

[12] - For PRN: # PPS, N=385, 211 (Groups 1 & 3) # Non-inferiority margin, 0.5.

Statistical analysis was based on an ANCOVA model with the log-transformed post-vaccination titres as response, the log-transformed baseline titres as covariate, the Infanrix hexa primary vaccination, the Region (nested effect) and the Group as fixed effects.

### **Secondary: Geometric Mean Titres (GMT) for Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2)**

End point title	Geometric Mean Titres (GMT) for Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2) <sup>[13]</sup>
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

End point description:

Antibody (Ab) titres were measured for Measles, Mumps & Rubella by ELISA, and for Varicella by gpELISA 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose.

Ab titres are expressed in ELISA mIU/mL for Measles, ELISA Ab units/mL for Mumps, IU/mL for Rubella, & gpELISA units /mL for Varicella.

Analysis was done on the Antigen-Specific Per Protocol Set (PPS), i.e. all randomised subjects initially

seronegative for those antigens (Measles Ab titre <255 mIU/mL, Mumps Ab titre <10 ELISA Ab units/mL, Rubella Ab titre <10 IU/mL, and Varicella Ab titre <1.25 gpELISA units/mL) excluding subjects with protocol violations which may interfere with the immunogenicity evaluation.

Note: (N=\*\*\*, \*\*\*) represents the number of assessed subjects in the "ProQuad + Infanrix hexa" and "ProQuad" groups, respectively.

End point type	Secondary
----------------	-----------

End point timeframe:

6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose.

Notes:

[13] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The objective of this endpoint was to evaluate the Geometric Mean Titres (GMT) for Measles, Mumps, Rubella, and Varicella 6 weeks after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose. So this endpoint did not concern subjects of the "Infanrix hexa" arm.

End point values	Group 1: ProQuad + Infanrix hexa	Group 2: ProQuad		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	431	215		
Units: Titres				
geometric mean (confidence interval 95%)				
Anti-Measles GMT (N=421, 215)	4581 (4148 to 5061)	4056 (3520 to 4672)		
Anti-Mumps GMT (N=427, 212)	116 (107 to 127)	126 (113 to 139)		
Anti-Rubella GMT (N=431, 215)	90 (83 to 97)	90 (81 to 99)		
Anti-Varicella GMT (N=394, 205)	16.64 (15.61 to 17.75)	15.31 (13.91 to 16.86)

**Secondary: Unsolicited injection-site reactions (ISRs) to ProQuad from D0 to D28 after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2)**

---

End point title	Unsolicited injection-site reactions (ISRs) to ProQuad from D0 to D28 after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose (Group 1 vs Group 2) <sup>[21]</sup>
-----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**End point description:**

Unsolicited injection-site adverse reactions (ISRs) to ProQuad occurring from D0 to D28, including erythema, pain, and swelling from D5 to D28 after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose, were reported.

AEs at ProQuad injection site were always considered as related to ProQuad (ISRs).

Percentage of subjects presenting at least once the considered ISRs are presented here.

Analysis was done on the Safety Analysis Set, i.e. all subjects who received at least 1 of the study vaccine(s) and who had safety follow-up data.

End point type	Secondary
----------------	-----------

End point timeframe:

From Day 0 (D0) to D28 after ProQuad dose 1, administered concomitantly or not with Infanrix hexa booster dose.

Notes:

[21] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The objective of this endpoint was to evaluate the unsolicited ISRs to ProQuad vaccine. So this endpoint did not include the "Infanrix hexa" arm.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Unsolicited non-serious systemic adverse events (AEs) were collected from D0 to D28 following vaccination.

Serious AEs and deaths were collected throughout the study.

Adverse event reporting additional description:

Analysis of AEs was performed on the Safety Analysis Set, i.e. all subjects who received at least 1 of the study vaccine(s) and who had safety follow-up data.

Unsolicited non-serious systemic AEs (vaccine-related or not) with incidence  $\geq 1\%$  in at least 1 reporting group are presented hereafter.

None of the serious AEs were vaccine-related.

Assessment type	Non-systematic

### Reporting groups

Reporting group title	Group 1: ProQuad + Infanrix hexa
-----------------------	----------------------------------

Reporting group description:

# Subjects received ProQuad dose 1 by subcutaneous route concomitantly with Infanrix hexa (DTaP-HBV-IPV-Hib) booster dose by intramuscular route at 12-23 months of age.

# Respectively, 332 (70.0%) subjects reported at least 1 non-serious unsolicited systemic AE, 152 (32.1%) subjects reported at least 1 ProQuad-related non-serious unsolicited systemic AE, and 100 (21.1%) subjects reported at least 1 Infanrix hexa-related non-serious unsolicited systemic AE within 28 days after ProQuad dose 1 administered concomitantly with Infanrix hexa booster dose.

Reporting group title	Group 2: ProQuad
-----------------------	------------------

Reporting group description:

# Subjects received ProQuad dose 1 by subcutaneous route at 12-23 months of age.

# Respectively, 152 (65.0%) subjects reported at least 1 non-serious unsolicited systemic AE, and 69 (29.5%) subjects reported at least 1 ProQuad-related non-serious unsolicited systemic AE within 28 days after ProQuad dose 1.

Reporting group title	Group 3: Infanrix hexa
-----------------------	------------------------

Reporting group description:

# Subjects received Infanrix hexa (DTaP-HBV-IPV-Hib) booster dose by intramuscular route at 12-23 months of age.

# Respectively, 149 (62.3%) subjects reported at least 1 non-serious unsolicited systemic AE, and 40 (16.7%) subjects reported at least 1 Infanrix hexa-related non-serious unsolicited systemic AE within 28 days after Infanrix hexa booster dose.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 September 2007	Update of study calendar due to the extension of the subject recruitment period, and the changes in the distribution of subjects between Germany and Italy (competitive recruitment) implemented to ensure the best recruitment rate and the achievement of the global targeted included population. (This change was not expected to impact the primary objective of the study since both Infanrix hexa primary vaccination schedules provide similar protection to the subjects. In addition, the statistical models include stratification by country.)
26 November 2007	Further updated study calendar required in order to ensure the planned sample size, and the labelling of the new lot of ProQuad which was sourced from commercial product.
11 March 2008	Changes implemented concerning polio testing (Vero cells replacing Hep-2 cells).

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
