## General information about the trial

Main objective of the trial:

To determine the effect of conversion from calcineurin inhibitor (CNI)- to sirolimus (SRL)-based therapy on renal function 52 weeks after randomization, as indicated by the change from baseline calculated glomerular filtration rate (GFR) (Nankivell method), and to demonstrate:

a) superiority of the SRL conversion versus CNI continuation regimens in subjects with baseline Nankivell GFRs greater than ( $>$ ) 40 milliliter per minute (mL/min). OR

b) noninferiority of the SRL conversion versus CNI continuation regimens in subjects with baseline Nankivell GFRs of 20 to 40 mL/min, and to establish superiority in this group if the results are consistent with this conclusion.

To assess equivalence 52 weeks after randomization between treatment groups in the composite endpoint of the incidence of the first occurrence of biopsy-confirmed acute rejection, graft loss, or death.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.
