

## Clinical trial results:

### Adjunctive antimicrobial therapy of periodontitis: Long-term effects on disease progression and oral microbiological colonization

#### Summary

EudraCT number	2006-005854-61
Trial protocol	DE
Global end of trial date	31 December 2011

#### Results information

Result version number	v1 (current)
This version publication date	05 October 2019
First version publication date	05 October 2019

#### Trial information

##### Trial identification

Sponsor protocol code	KKS/MueParo/Antibiotics and Periodo
-----------------------	-------------------------------------

##### Additional study identifiers

ISRCTN number	ISRCTN64254080
ClinicalTrials.gov id (NCT number)	NCT00707369
WHO universal trial number (UTN)	-

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

---

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	25 May 2012
Is this the analysis of the primary completion data?	Yes
Primary completion date	31 December 2011
Global end of trial reached?	Yes
Global end of trial date	31 December 2011
Was the trial ended prematurely?	No

Notes:

---

## General information about the trial

Main objective of the trial:

The addressed research objectives are: (i) What is the size of the benefit of an adjunctive empiric antibiotic therapy compared to standard mechanical debridement and oral hygiene instructions in a representative sample of German periodontitis patients? (ii) Does the administration of the antibiotic therapy delay recurrence of periodontitis in the general population and in specific high risk groups (e.g. smokers) under standard supportive therapy? (iii) Is the presence of specific microbial complexes a useful predictor of outcome and recurrence of periodontitis? (iv) Does the administration of the antibiotic therapy affect the oral health related quality of life?

Protection of trial subjects:

In the proposed trial, control patients receive standard periodontal treatment and test patients standard therapy plus adjunctive antibiotics. In general, the side effects of these therapies are known and events causing early termination are extremely unlikely.

However, an early termination strategy is foreseen in the proposed trial. Early termination ("exit strategy") will depend on the incidence of "periodontal abscesses" as defined by Meng 1999, i.e., "localized purulent infection within the tissues adjacent to the periodontal pocket that may lead to destruction of periodontal ligament and alveolar bone". Periodontal abscesses represent a dental emergency situation in periodontal therapy. Such abscesses are most frequently seen in patients receiving inadequate periodontal therapy or in untreated patients. Teeth showing periodontal abscesses can be maintained over years if they are treated adequately (McLeod et al. 1997). Therefore, this parameter helps discover inadequate therapy throughout the study without causing irreversible harm (i.e., tooth loss) to the participants. During interim analysis the incidence of periodontal abscesses in both groups will be calculated. In case of a 50% difference (at least 20% of all patients in one group must suffer from this condition) between the groups, the trial will be terminated immediately.

Background therapy:

- Mechanical debridement
- Supportive periodontal therapy in 3-month intervals

Evidence for comparator:

Standard of care includes mechanical removal of the biofilm, i.e., initial subgingival debridement and lifelong supportive periodontal therapy. The outcome of mechanical therapy is variable and further disease progression may occur. Beyond this approach, patients might benefit from the adjunctive use of systemic antibiotics. Via saliva and serum, these agents may affect periodontal and intraoral sites inaccessible for mechanical therapy.

Although systemic antibiotics are frequently used therapeutic agents in dentistry, their prescription often is not evidence-based (Palmer et al. 2000). In two recent systematic reviews of the impact of various adjunctive antibiotic agents in periodontal therapy released by the European Federation of Periodontology (EFP, Herrera et al. 2002) and the American Academy of Periodontology (AAP, Haffajee et al. 2003), methodological weaknesses of existing studies were described. Due to various study designs, small sample sizes, mixed populations, use of weak parameters for disease progression determination, and short duration of the studies, definitive conclusions about the efficacy of adjunctive antimicrobial therapy have not yet been possible. Both reviews concluded that adjunctive antimicrobial therapy may offer a clinical benefit but further studies are needed.

Actual start date of recruitment	01 October 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 506
Worldwide total number of subjects	506
EEA total number of subjects	506

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	432
From 65 to 84 years	74
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

recruitment: October 2008-October 2009

Overall 3261 patients were screened, 1004 met the inclusion criteria, 461 declined to participate, and 506 were randomized.

### Pre-assignment

Screening details:

All study centers (Departments of Periodontology of the Universities of Berlin (Humboldt), Dresden, Frankfurt, Gießen, Greifswald, Heidelberg, Münster (coordinating center), and Würzburg) have been selected with respect to their special expertise in the field of periodontology and their feasibility of adequate patient recruitment.

During one year

### Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Assessor

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	test group (antibiotics)

Arm description:

All patients receive routine supragingival and subgingival debridement with sonic/ultrasonic scalers using micro tips or hand instruments (curettes) under local anesthesia. Finally, polishing with an air powder device or pumice and rotating rubber cups is performed. Initial therapy is performed in two sessions on two consecutive days. After completion of mechanical debridement, patients receive an adjunctive antimicrobial therapy consisting of oral metronidazole 400mg and amoxicillin 500mg (three times daily, for seven days).

Arm type	Experimental
Investigational medicinal product name	Amoxicillin 3H2O 574 mg (Amoxicillin-ratiopharm 500mg®, Ratiopharm, Germany) and Metronidazole 400 mg (Flagyl® 400, Sanofi-Aventis, Germany)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Patients receive an adjunctive antimicrobial therapy consisting of oral metronidazole 400mg and amoxicillin 500mg (three times daily, for seven days)

<b>Arm title</b>	control group (placebo)
------------------	-------------------------

Arm description:

Finally, polishing with an air powder device or pumice and rotating rubber cups is performed. Initial therapy is performed in two sessions on two consecutive days. After completion of mechanical debridement, patients receive two placebo drugs (three times daily, for seven days).

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo P1 & P2 (Cellulosepowder, Lactose-Monohydrat, Magnesiumstearat (Ph. Eur.), mikrokristalline Cellulose)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Two placebo drugs, to be taken three times a day for seven days.

<b>Number of subjects in period 1</b>	test group (antibiotics)	control group (placebo)
Started	251	255
Completed	206	200
Not completed	45	55
Adverse event, serious fatal	1	1
Adverse event, non-fatal	2	4
Protocol deviation	42	50

## Subject analysis sets

Subject analysis set title	Test group (antibiotics, ITT)
Subject analysis set type	Intention-to-treat

### Subject analysis set description:

The intention-to-treat collective (test group) contains all patients who were randomized to receive antibiotics and had measurements at the baseline visit and final visit (27.5 months) after randomization. The patients will be analyzed using the intention-to-treat principle (ITT) according to the randomized treatment regardless of protocol violations. Within 1.5 months after baseline examination (visit 2), patients received supra- and subgingival debridement in up to two sessions on two consecutive days. All mechanical therapy was performed with different hand instruments and/or machine driven scalers. After completion of mechanical therapy, in the antibiotics group patients received two empiric antibiotics [amoxicillin 3H2O 574 mg (Amoxicillin-ratiopharm 500 mg®, Ratiopharm, Germany); metronidazole 400 mg (Flagyl® 400, Sanofi-Aventis, Germany)] each to be taken three times a day for seven days.

Subject analysis set title	Control group (placebo, ITT)
Subject analysis set type	Intention-to-treat

## End points

### End points reporting groups

Reporting group title	test group (antibiotics)
-----------------------	--------------------------

Reporting group description:

All patients receive routine supragingival and subgingival debridement with sonic/ultrasonic scalers using micro tips or hand instruments (curettes) under local anesthesia. Finally, polishing with an air powder device or pumice and rotating rubber cups is performed. Initial therapy is performed in two sessions on two consecutive days. After completion of mechanical debridement, patients receive an adjunctive antimicrobial therapy consisting of oral metronidazole 400mg and amoxicillin 500mg (three times daily, for seven days).

Reporting group title	control group (placebo)
-----------------------	-------------------------

<b>Statistical analysis title</b>	Primary efficacy analysis PSAL (ITT)
-----------------------------------	--------------------------------------

Statistical analysis description:

Comparison between the antibiotics and placebo group in the intention-to-treat collective. The confirmatory analysis of the primary endpoint was performed using a stratified Wilcoxon-Test (van Elteren). The four strata were defined as follows: stratum 1 (localized periodontal disease, non-/light smoker), stratum 2 (generalized periodontal disease, non-/light smoker), stratum 3 (localized periodontal disease, smoker) and stratum 4 (generalized periodontal disease, smoker).

Comparison groups	Test group (antibiotics, ITT) v Control group (placebo, ITT)
Number of subjects included in analysis	406
Analysis specification	Pre-specified
Analysis type	superiority <sup>[1]</sup>
P-value	< 0.001
Method	Stratified Wilcoxon test (van Elteren)

Notes:

[1] - A two-sided p-value less than 0.05 will be considered as significant.

<b>Statistical analysis title</b>	Sensitivity analysis PSAL (PP)
-----------------------------------	--------------------------------

Statistical analysis description:

Comparison between the antibiotics and placebo group in the per-protocol collective. The analysis was performed using a stratified Wilcoxon-Test (van Elteren). The four strata were defined as follows: stratum 1 (localized periodontal disease, non-/light smoker), stratum 2 (generalized periodontal disease, non-/light smoker), stratum 3 (localized periodontal disease, smoker) and stratum 4 (generalized periodontal disease, smoker).

Comparison groups	Test group (antibiotics, PP) v Control group (placebo, PP)
-------------------	--

Number of subjects included in analysis	345
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.001
Method	Stratified Wilcoxon test (van Elteren)

### Secondary: Proportion of sites per patient with new clinical attachment gain (PSAG) $\geq 1.3$ mm between baseline and the 27.5 months visit

End point title	Proportion of sites per patient with new clinical attachment gain (PSAG) $\geq 1.3$ mm between baseline and the 27.5 months visit
-----------------	---

End point description:

End point type	Secondary
----------------	-----------

End point timeframe:

PSAG was determined for each patient by calculating the percentage of sites with a larger improvement than 1.3 mm in the relative attachment level (mm) between baseline (visit 2) and 27.5 months (visit 12).

End point values	Test group (antibiotics, ITT)	Control group (placebo, ITT)	Test group (antibiotics, PP)	Control group (placebo, PP)
Subject group type	Subject analysis set	Subject analysis set	Subject analysis set	Subject analysis set
Number of subjects analysed	206	200	170	175
Units: percent				
median (inter-quartile range (Q1-Q3))	19.4 (10.4 to 32.7)	12.2 (7.1 to 23.0)	19.6 (10.3 to 32.1)	12.8 (7.2 to 23.5)

### Statistical analyses

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

01.10.2008 - 31.12.2011

Adverse event reporting additional description:

All adverse events occurring during the trial period including the 14 days after visit 12 (informed consent – visit 12) have to be documented in the AE-form of the CRF including assessment of severity.

Assessment type	Systematic
-----------------	------------

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 December 2007	<ul style="list-style-type: none"><li>-During visit eight a blood sample will be given on a DNA storage card (e.g. FTA Elute Microcard, Whatman). The cards can be stored at room temperature and will be shipped collectively to the coordinating center for further processing at the end of the study.</li><li>-EDTA-blood (10ml, 1 sample) will be taken during visits 1, 8 and 12 to determine the course of inflammatory disease parameters (e.g. CRP, etc.) and HbA1c. The sample will be shipped immediately for further processing in special gusseted wallets (to ensure specimen containment) to the clinical chemistry laboratory of the University of Greifswald.</li></ul>
24 June 2008	<ul style="list-style-type: none"><li>- Changes made for: Subject Inclusion Criteria, Subject Exclusion Criteria and Subject Withdrawal Criteria</li><li>-EDTA-blood (10ml, 1 sample) will be taken during visits 1, 8 and 12 to determine the course of inflammatory disease parameters (e.g. CRP, etc.) and HbA1c.</li><li>-At every visit the examiner has to perform a routine inspection. First the medical health history (MHH) has to be checked. Changes have to be documented in the MHH and the CRF. Changes within the medication must be also documented in the MHH and additionally in the CRF if they belonging to the following six medication groups: 1. Antibiotics, 2. ASS for more than 4 weeks, 3. Medication for cardiovascular and/ or heart diseases, 4. Medication for thyroid diseases, 5. Medication for gastro-intestinal diseases, 6. Medication for asthma (allergic/ bronchial). The medication group should be marked with a cross in the CRF and the name and dosage should be documented. Following the clinical inspection will be done. The existence of periodontal abscesses has to be excluded. If there is a periodontal abscess, the tooth has to be documented in the CRF as well. Additionally, the examiner has to check the occlusal relief versus the intraoral photographs of visit 2 (occlusal inspection at visits 4, 6, 8, 10, 12). Changes have to be documented in the CRF. Finally, it has to be proved if there were any adverse or serious adverse events. If yes, it has to be specified on AE/ SAE form.</li><li>- Change: OHIP-G was changed to OHIP-G49</li><li>-The HbA1c will be assessed centralized at the Institut für Klinische Chemie und Laboratoriumsmedizin (IKCL), University of Greifswald. HbA1c will be assessed in the blood samples which are taken at visit one, eight and twelve.</li><li>- New definitions for: Adverse reaction (AR) and Serious adverse event or serious adverse reaction (SAE or SAR)</li></ul>

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
