

Clinical trial results:

Efficacy and safety of two dose regimens of Octaplex in patients with intracranial haemorrhage related to oral anticoagulant therapy: a multicentre, prospective, randomised, open-label study.

Analysis stage	Final
Date of interim/final analysis	26 January 2012
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	16 April 2011
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary study objective was to compare the efficacy of two dose regimens of Octaplex on the INR at 10 ± 5 minutes after the end of injection in patients with intracranial haemorrhage related to oral anticoagulant therapy.

Protection of trial subjects:

The study was conducted in accordance with the ethical principles of the Declaration of Helsinki, and ICH-GCP, and national regulatory requirements. In- and exclusion criteria were carefully defined in order to protect subjects from contraindications, interactions with other medication and safety factors associated with the investigational medicinal product. Throughout the study safety was assessed, such as occurrence of adverse events, lab values, vital signs and physical examinations.

Background therapy:

Octaplex was administered as a single dose, by intravenous infusion. All patients were also given 5 mg vitamin K.

Evidence for comparator:

N.A.

Actual start date of recruitment	07 November 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	France: 59
Worldwide total number of subjects	59
EEA total number of subjects	59

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	7
From 65 to 84 years	38
85 years and over	14

Subject disposition

Recruitment

Recruitment details:

Studied Period: FPI 07-NOV-2008 and LPO 16-APR-2011.

In total 59 patients suffering from intracranial haemorrhage related to oral anticoagulant therapy were enrolled from 15 active study sites in France.

Pre-assignment

Screening details:

Patients of 18 years of age or older, Intracranial haemorrhage (intracerebral and acute subdural) confirmed by medical imaging (CT-scan only), use of oral anticoagulant, vitamin K antagonists only, written informed consent from the patient or a legally acceptable representative.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Octaplex 25 IU/kg

Arm description:

Octaplex was administered as a single dose by intravenous infusion (at the standard dose) in accordance with the randomisation. All patients were also given 5 mg vitamin K.

Throughout the stay in the hospital, efficacy and safety assessments were performed at precise time points calculated from the end of Octaplex infusion: The medical part of the study ended on Day 30 (or the last day of hospitalisation if the patient was discharged earlier) after the Octaplex infusion. Three months after the Octaplex infusion, patients had to complete a quality of life (SF-36) and a pharmacoeconomic self-questionnaire.

Arm type	Experimental
Investigational medicinal product name	Octaplex
Investigational medicinal product code	ATC B02BD01
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

Standard dose (25 IU/kg).

There were only two infusion speed groups: the low (≥ 3 mL/min and < 8 mL/min) and the high (≥ 8 mL/min) infusion speed group, which included 20 and 39 patients, respectively, in the FAS and 18 and 35 patients, respectively, in the PP Set.

Arm title	Octaplex 40 IU/kg
------------------	-------------------

Arm description:

Octaplex was administered as a single dose by intravenous infusion (at the high dose) in accordance with the randomisation. All patients were also given 5 mg vitamin K. Throughout the stay in the hospital, efficacy and safety assessments were performed at precise time points calculated from the end of Octaplex infusion: The medical part of the study ended on Day 30 (or the last day of hospitalisation if the patient was discharged earlier) after the Octaplex infusion. Three months after the Octaplex infusion, patients had to complete a quality of life (SF-36) and a pharmacoeconomic self-questionnaire. less

Arm type	Experimental
Investigational medicinal product name	Octaplex
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

High dose (40 IU/kg).

There were only two infusion speed groups: the low (≥ 3 mL/min and < 8 mL/min) and the high (≥ 8 mL/min) infusion speed group, which included 20 and 39 patients, respectively, in the FAS and 18 and 35 patients, respectively, in the PP Set.

Number of subjects in period 1	Octaplex 25 IU/kg	Octaplex 40 IU/kg

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
30 June 2008	<p>Amendment No. 1</p> <ul style="list-style-type: none">• The CT scan imaging technique only was allowed at inclusion to confirm diagnosis and at 48 hours to evaluate the haematoma volume. The same technique had to be used at inclusion and 48 hours. If CT scan and MRI are commonly used to confirm diagnosis, CT scan is preferred at 48 hours for control imaging.• Modification of the exclusion criteria: Some exclusion criteria needed an explanation for a better understanding. General seizure has been deleted as they are frequently associated with intracranial haemorrhage.• Modification of Octaplex administration: According to Scientific Committee members request (Pr P. Coriat, principal investigator and Pr B. Riou, investigator, Dr B. Vigué and Pr. C Négrier), an additional Octaplex dose could be administered at 10 ± 5 minutes and at 6 hours after the first Octaplex infusion, following precise recommendation and not at the discretion of the investigator. The recommendation was 1.5 as target INR for the first rescue dose. The table has been simplified to facilitate the additional dose calculation by the investigators.• Modification of Octaplex infusion rate: The context of very high emergency implies to shorten all the delays in patient care including treatment administration.• Update of information on Octaplex storage (new Octaplex variation approved by reference member state via Mutual Recognition Procedure in 30-Nov-2007).• New laboratory parameters: Digital glucose was performed instead of being analysed in the laboratory. Additional laboratory tests were done (liver function, haematology) in order to follow the overall safety data.
30 June 2008	<p>Amendment No. 2</p> <ul style="list-style-type: none">• Modification of the informed consent procedure: The previous procedure was not adapted to the emergency situation. According to the law, in emergency situations, if prior informed consent of the patient is not possible and the patient's legally acceptable representative is not available, the patient can be enrolled without prior informed consent. The informed consent procedure was modified in consequence: if the patient's legally acceptable representative was not available, the patient could be included by the investigator in presence of a witness independent from the investigator and the Sponsor.• Because of the change of the informed consent procedure, the patient concomitant disability could not be assessed by the physician if the patient's legally acceptable representative was absent. This exclusion criterion was thus suppressed.• Population of the study better defined: The type of intracranial haemorrhage has been precisely defined for a better understanding.

22 August 2008	<p>Amendment No. 3</p> <ul style="list-style-type: none"> • Modification of biological analyses: Some of the centralised analyses (fibrin degradation products and thrombin-prothrombin complexes) have been cancelled with the agreement of the central laboratory, in order to lighten plasma tubes preparation for local laboratories. Moreover, central laboratory analyses were only to be performed in the centres that possessed laboratory facilities (adequate devices and personnel during night and day) to prepare plasma tubes. The laboratory parameters analysis was performed locally or centrally upon local laboratory facilities. • ECG surveillance: ECG is monitored continuously during the whole stay in the investigator's ward, thus the surveillance at 48 hours was added. • Modification of the determination of sample size based on the results obtained from previous studies with Octaplex. • Precision of the anticoagulant therapy: The type of anticoagulant therapy has been added. Only patients under vitamin K antagonist therapy were admitted. • Precision of the type of subdural haematoma: Only patients with acute subdural haematoma were admitted. This criterion was assessed by CT scan.
17 December 2008	<p>Amendment No. 5</p> <ul style="list-style-type: none"> • Change of Sponsor: Octapharma France SAS (Boulogne-Billancourt, France) replaced Octapharma AG (Lachen, Switzerland). • Modification of the sample labels for investigational medicinal products: Addition of FIX content in Octaplex and change of Sponsor. • Modification of the study duration: Due to the late clinical study start, the study duration was prolonged accordingly.
03 August 2009	<p>Amendment No. 6</p> <ul style="list-style-type: none"> • In the entire text, thrombin generation assay (TGA) analysis was suppressed. The results of TGA analysis in the first patients included in the study were not interpretable due to a bad plasma preparation. As this test was still experimental, it was decided to stop this analysis in agreement with Pr Negrier (Head of Central Laboratory). • In the entire text, a time window of 15 minutes before and 15 minutes after the fixed time points 1 hour, 3 hours, 6 hours and 24 hours was added. As this study was carried out in a context of emergency, it appeared that greater flexibility in the times of blood sample collection was appropriate to avoid protocol deviations and give more comfort to the investigator during the care of patient. • In the entire text, the National Institute of Health (NIH) stroke scale was suppressed. As the NIH stroke scale was not usually used by most study investigators and requires a specific training, it was decided to not perform this scale anymore. Alternatively, the neurological worsening was assessed by a routine neurological examination. • An English translation, certified by a sworn translator, of the Informed consent and the Patient information approved by the IEC on 01-Jul-2008 was added to Appendix 2 of the protocol. This translation was supplied, for information, to two patients speaking English.
18 November 2009	<p>Amendment No. 7</p> <ul style="list-style-type: none"> • Modification of the study duration: Due to a recruitment rate below what was expected, the duration of the study had to be extended accordingly.
15 September 2010	<p>Amendment No. 8</p> <ul style="list-style-type: none"> • Modification of the study duration: Due to a recruitment rate below what was expected, the duration of the study had to be extended accordingly.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
