

**Clinical trial results:**

A randomised Phase III trial to evaluate the efficacy of chemoimmunotherapy with the monoclonal antibody Campath-1H (Alemtuzumab) given in combination with 2-weekly CHOP (Cyclophosphamide, Doxorubicin, Vincristine and Prednisone) versus 2-weekly CHOP alone in elderly patients with previously untreated systemic T- cell Lymphoma Short Title: A-CHOP-14 (elderly)

Analysis stage	Final
Date of interim/final analysis	14 February 2017
Is this the analysis of the primary completion data?	Yes
Primary completion date	31 March 2016
Global end of trial reached?	Yes
Global end of trial date	31 March 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Improvement of the efficacy of chemotherapy with CHOP-14 by the additional use of the CD52 monoclonal antibody alemtuzumab measured on the basis of Event-free Survival

Protection of trial subjects:

Before launching the trial, it was mentioned in the protocol that patients aged 71 - 80 years will be treated in a separate stratum because the tolerability of chemotherapy is poorer in patients of advanced age. Special safety criteria will apply to patients >70 years of age which will include an extensive toxicity analysis during the interim restaging.

In case of a clinically symptomatic CMV disease, both alemtuzumab and CHOP-therapy are stopped and an intravenous therapy with ganciclovir (10 mg/kg BW) initiated. The diagnosis of CMV-disease has to be made on clinical grounds, based on typical organ involvement (pneumonia, retinitis, enterocolitis) and detection of the virus in the blood (pp65, PCR) or in a biopsy of the organ involved.

Neutropenia is a common side-effect of ganciclovir and valganciclovir. Monitoring of neutrophil counts is an effective and sensitive safety parameter during treatment. Likewise, regular monitoring of creatinine clearance for dose adaptation of ganciclovir or valganciclovir in case of renal insufficiency is essential.

In cases of asymptomatic EBV reactivation detected by quantitative PCR, alemtuzumab is stopped.

When peripheral blood leukocytes are above the threshold of 2.500/μl, CHOP chemotherapy should be applied without delay. Alemtuzumab treatment should be restarted as soon as EBV-monitoring is negative again, and the alemtuzumab doses omitted should be added to the treatment schedule in two-week intervals at the end of therapy to ensure the full cumulative alemtuzumab dose to be applied. In cases of symptomatic EBV disease, immunochemotherapy should be stopped, and the trial office be consulted.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	12 October 2007
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy, Ethical reason, Regulatory reason, Scientific research
Long term follow-up duration	2 Years
Independent data monitoring committee (IDMC) involvement?	Yes

85 years and over	0

Subject disposition

Recruitment

Recruitment details:

recruitment was planned for a period of 4 years. Based on the experience of significant patient accrual delay in the first year due to center activation, the recruitment was extended to 6 years in amendment 2 (26.04.2010). There was temporary trial hold in recruitment (waiting for the safety analysis results): 08.04.2010 - 02.06.2010

Pre-assignment

Screening details:

It was planned in the protocol to recruit 274 patients between 61 - 80 years old. 116 patients from 52 hospitals were eligible to participate in the study. 58 patients in each group. 40 patients from the Standard arm were recruited after the protocol amendment (28.04.2010), while 37 patients from the Experimental arm recruited after that amendment.

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	standard arm

Arm description:

After the prephase treatment completion; patients receive six cycles of chemotherapy (CT) (CHOP-14): cyclophosphamide (750 mg/m² - IV), doxorubicin (50 mg/m² - IV), vincristine (1,4 mg/ m², with maximum of 2 mg - IV) and prednisone (100mg absolute p.o.) with G-CSF support. All CT started from day 1 & prednisolone from day 1 - 5.

CHOP-14 is to be repeated on day 15. Prerequisites for the continuation of this therapy are:

1. Patient has passed the leukocyte and platelet nadir.
2. Leukocyte count >2500/mm³ (or neutrophil count >= 1x10⁹/l) on day 15 after discontinuation of G-CSF &
3. Platelet count >80 000/mm³/l) on day 15
4. No active infection
5. No serious organ or other toxicity.

Arm type	Active comparator
Investigational medicinal product name	Vincristine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

as part of the CHOP-14 regimen:
Vincristine 1,4 mg/ m², with a i.v.
maximum of 2 mg day 1

Investigational medicinal product name	prednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

As part of the CHOP-14 regimen:

Prednisone 100 mg (absolute) p.o. day 1 - 5.

Tapering of prednisone: Prompt discontinuation of prednisone can result in marked fatigue, particularly in elderly patients. We recommend a gradual reduction of the prednisone dose, with administration of 50 mg on day 6, 25 mg on day 7 and 12.5 mg on day 8.

Investigational medicinal product name	Doxorubicin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

As part of the CHOP-14 regimen:

Doxorubicin 50 mg/m² i.v. day 1

Investigational medicinal product name	Cyclophosphamide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

As part of the CHOP-14 regimen:

Cyclophosphamide 750 mg/m² i.v. day 1

Arm title	Experimental arm
------------------	------------------

Arm description:

After the completion of the perphase treatment; patients receive six cycles of chemotherapy (CHOP-14): cyclophosphamide, doxorubicin, vincristine and prednisone with G-CSF support. In addition to the standard arm, patients receive six doses of the monoclonal CD52 antibody alemtuzumab 30 mg s.c. on day 1 of CHOP each at 14-day intervals.

If the thresholds (leukocytes >2500/mm³ and platelets >80000/mm³) are still not reached after a 1-week postponement of therapy (by day 22 after CHOP-14), further treatment should be delayed, with checks of blood counts every 3 days, until these values are reached.

Arm type	Experimental
Investigational medicinal product name	Vincristine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

as part of the CHOP-14 regimen:

Vincristine 1,4 mg/ m², with a i.v. maximum of 2 mg day 1

Investigational medicinal product name	Prednisone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

As part of the CHOP-14 regimen:

Prednisone 100 mg (absolute) p.o. day 1 – 5

Tapering of prednisone: Prompt discontinuation of prednisone can result in marked fatigue, particularly in elderly patients. We recommend a gradual reduction of the prednisone dose, with administration of 50 mg on day 6, 25 mg on day 7 and 12.5 mg on day 8.

Investigational medicinal product name	Cyclophosphamide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

As part of the CHOP-14 regimen:

Cyclophosphamide 750 mg/m² i.v. day 1

Investigational medicinal product name	Doxorubicin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

As part of the CHOP-14 regimen:

Doxorubicin 50 mg/m² i.v. day 1

Investigational medicinal product name	alemtuzumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Intravenous use

Dosage and administration details:

30 mg s.c. in the thighs on day 1 of CHOP. In course 1 of A-CHOP, the 1st dose of alemtuzumab may be split into 10 mg on day 1 & 20 mg on day 2 to minimize drug reactions. For s.c. admin. the content of an alemtuzumab ampoule is 30 mg per ml (taken up into a 2 ml syringe). One syringe filled with 1 ml alemtuzumab solution is injected into the left or right thigh, with care being taken to avoid repeated use of exactly the same injection site. At the start of treatment, local reactions can be experienced, such as mild swelling and reddening of the skin, sometimes painful; such reactions decrease during continued therapy. Prior to the initial administration, patients are to be given paracetamol 1g & 50-100 mg diphenhydramine hydrochloride or clemastine 2 mg 30 minutes prior to the s.c. injection. If the thresholds (leukocytes >2500/mm³ and platelets >80 000/mm³) are still not reached after 1-week postponement of therapy (by day 22 after CHOP-14) further treatment should be delayed.

Secondary: Prephase treatment

End point title	Prephase treatment
End point description:	
All patients in both arms were to receive prephase treatment prior to initiation of therapy. The purpose of the prephase treatment is to prevent tumour lysis syndrome in patients with extensive tumours, to improve the performance status of the patient and to reduce the toxicity of the first chemotherapy cycle. This treatment consists of: Vincristine: 1 mg i.v. day -6 (single dose), where day 1 = day 1 of CHOP therapy. Prednisolone: 100 mg p.o. day -6 through day zero, where day 1 = day 1 of CHOP therapy. The main therapy phase (CHOP and CHOP + alemtuzumab, respectively), must not be initiated before randomisation, and must directly follow the prephase treatment.

Dictionary version	17.1
--------------------	------

Reporting groups

Reporting group title	standard arm
-----------------------	--------------

Reporting group description:

After the prephase treatment completion; patients receive six cycles of chemotherapy (CT) (CHOP-14): cyclophosphamide (750 mg/m² - IV), doxorubicin (50 mg/m² - IV), vincristine (1,4 mg/ m², with maximum of 2 mg - IV) and prednisone (100mg absolute p.o.) with G-CSF support. All CT started from day 1 & prednisolone from day 1 - 5.

CHOP-14 is to be repeated on day 15. Prerequisites for the continuation of this therapy are:

1. Patient has passed the leukocyte and platelet nadir.
2. Leukocyte count >2500/mm³ (or neutrophil count $\geq 1 \times 10^9/l$) on day 15 after discontinuation of G-CSF &
3. Platelet count >80 000/mm³ on day 15
4. No active infection
5. No serious organ or other toxicity.

Reporting group title	Experimental arm
-----------------------	------------------

Reporting group description:

After the completion of the prephase treatment; patients receive six cycles of chemotherapy (CHOP-14): cyclophosphamide, doxorubicin, vincristine and prednisone with G-CSF support. In addition to the standard arm, patients receive six doses of the monoclonal CD52 antibody alemtuzumab 30 mg s.c. on day 1 of CHOP each at 14-day intervals.

If the thresholds (leukocytes >2500/mm³ and platelets >80000/mm³) are still not reached after a 1-week postponement of therapy (by day 22 after CHOP-14), further treatment should be delayed, with checks of blood counts every 3 days, until these values are reached.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 April 2010	Based on the experiences in in the ACT-1 trial, in which an increased rate of opportunistic infections had been observed, an extraordinary safety analysis was performed as soon as the 30th patient had completed the full treatment course in the ACT-2 trial. This safety analysis was discussed with the DSMB and the trial steering group, leading to a temporary hold of recruitment communicated to the trial centers on 08 April 2010. An amendment reducing the dose of alemtuzumab was prepared and submitted to EC as well as the competent authorities. As of 26 May 2010 and 02 June 2010, respectively the German national authority (PEI) and the lead EC in Goettingen approved the amendment of the trial, with the exclusion of anaplastic large cell from this trial and the reduction of alemtuzumab to 30 mg per cycle in the first 4 cycles of the experimental A-CHOP arm of the trial. There was another previous amendment to the protocol on January 26, 2009. As per initial protocol of the trial, recruitment into the trial was planned for a period of 4 years. Based on the experience of significant patient accrual delay in the first year of the trial due to center activation, the time period for recruitment was extended to 6 years in the 2nd amendment, as 26 April 2010.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
08 April 2010	emporary trial hold: 08 April 2010 through 02 June 2010: Based on the experiences in in the ACT-1 trial, in which an increased rate of opportunistic infections had been observed, an extraordinary safety analysis was performed as soon as the 30th patient had completed the full treatment course in the ACT-2 trial. This safety analysis was discussed with the DSMB and the trial steering group, leading to a temporary hold of recruitment communicated to the trial centers on 08 April 2010.	02 June 2010
