Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	12 March 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	29 December 2010
Global end of trial reached?	Yes
Global end of trial date	29 December 2010
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary aim of this trial was to investigate whether patients randomized to Cerebrolysin showed improved ARAT scores over the 90-day study observation period in comparison with patients randomized to placebo.

Protection of trial subjects:

Informed consent was obtained from all trial subjects.

Safety assessments included physical examination, lab tests (haematology, chemistry panel and urinalysis), vital signs (incl. blood pressure in supine position, heart rate, and respiration rate), and adverse events.

A negative urine pregnancy test was required for female patients in reproductive years.

Concomitant illnesses and medication were documented.

Background therapy:

At the investigator's discretion: Basic stroke treatment for general management including thrombolysis on an as-needed basis without restriction, a compensation of fluid and electrolyte balance and acid-base balance, and substances needed for adequate management of secondary symptoms including but not limited to antihypertensive agents, cardiovascular treatment, anti-diabetic agents, antibiotics, and treatment for sleep disturbances and body temperature lowering.

Evidence for comparator:

The comparator is a placebo (sodium chloride solution 0.9%).

Actual start date of recruitment	17 April 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Romania: 182
Country: Number of subjects enrolled	Ukraine: 26
Worldwide total number of subjects	208
EEA total number of subjects	182

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	97
From 65 to 84 years	111
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Recruitment period: 17 April 2008 - 01 October 2010

Recruitment territories: Romania (N=182; 8 sites), Ukraine (N=26; 3 sites), Poland (N=0)

Pre-assignment

Screening details:

In-patients were screened for in-/exclusion criteria.

Screening failures and reasons were not documented as agreed pre-study.

Period 1

Period 1 title	Baseline period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Subject, Carer, Assessor

Blinding implementation details:

The packaging material for the infusion solution was designed to ensure the study medication of both treatment groups to be indistinguishable in appearance:

- the volume of the infusion solution was identical in both treatment groups
- a colored sleeve was put over the infusion bag to mask potential slight colour differences between the active treatment and placebo.

Arms

Are arms mutually exclusive?	Yes
Arm title	Cerebrolysin

Arm description:

Cerebrolysin was administered once daily as an intravenous infusion. Each infusion consisted of 30 ml Cerebrolysin + 70 ml sodium chloride solution 0.9%. The infusion was administered over 20 minutes, once daily over 21 consecutive days. The first infusion was administered after baseline assessment and within 24-72 h after onset of stroke.

Arm type	Experimental
Investigational medicinal product name	Cerebrolysin
Investigational medicinal product code	EV Substance code: SUB74627; CAS number:12656-61-0
Other name	Renacenz, Cognicer
Pharmaceutical forms	Solution for injection, Solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Dosage: 30 ml/day (3x10 ml ampoules)

Administration: intravenous infusion of 30 ml Cerebrolysin + 70 ml sodium chloride solution 0.9%, once daily for 21 consecutive days

Arm title	Placebo
------------------	---------

Arm description:

Placebo was administered once daily as an intravenous infusion. Each infusion consisted of 100 ml sodium chloride solution 0.9%. The infusion was administered over 20 minutes, once daily over 21 consecutive days. The first infusion was administered after baseline assessment and within 24-72 h after onset of stroke.

Arm type	Placebo
Investigational medicinal product name	Sodium chloride solution 0.9%
Investigational medicinal product code	EV Substance code: SUB20079
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Dosage: 100 ml/day

Administration: intravenous infusion, once daily for 21 consecutive days

Subject analysis set title	mITT-LOCF (nonparametric re-analysis)
----------------------------	---------------------------------------

Subject analysis set type	Modified intention-to-treat
---------------------------	-----------------------------

Subject analysis set description:

The mITT analysis set was defined as all randomized patients who have had at least 1 dose of study medication and have assessments for the primary end point (ARAT) at baseline and at least 1 time point after the first dose of study medication.

Subject analysis set title	Full analysis LOCF (parametric analysis)
----------------------------	--

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

All randomized patients who have had at least one dose of study medication and have assessments for the primary endpoint (ARAT score) at baseline and at least one time point after first dose of study medication.

Primary: ARAT score change from baseline to day 90 in the paretic arm

End point title	ARAT score change from baseline to day 90 in the paretic arm
-----------------	--

End point description:

The Action Research arm test (ARAT) assesses upper limb functioning and is a 19 item measure divided into 4 sub-tests (grasp, grip, pinch, and gross arm movement). Performance on each item is rated on a 4-point ordinal scale (performs test normally: 3, completes test but takes abnormally long or has great difficulty: 2, performs test partially: 1, can perform no part of test: 0). The first item of each sub-test represents the most difficult item, thus, if a patient scores 3 points on the first item, he will be automatically credited with 3 points on the following items of that sub-test. Similarly, the second item of each sub-test represents the easiest item, thus, if a patient scores 0 points in the second item, he will be automatically credited with 0 points on the following items of that sub-test. The score ranges from 0 – 57.

Statistical analyses

Statistical analysis title	ARAT change from baseline - parametric analysis
-----------------------------------	---

Statistical analysis description:

The primary evaluation on ARAT was an analysis of covariance (ANCOVA) on the change scores from baseline to day 90 comparing the differences among study groups. The ANCOVA model included the day 90 change score as dependent variable and the baseline score as a covariate. Estimates of least square means and associated 95% confidence intervals were provided. The LOCF approach was used for missing data, baseline data were not carried forward.

Statistical analyses

Statistical analysis title	Nonparametric re-analysis of ARAT
-----------------------------------	-----------------------------------

Statistical analysis description:

Nonparametric analyses were performed using the Wilcoxon–Mann–Whitney test because of the skewness and non-normality of the distributions (Shapiro–Wilk; $P=0.0137$) and the presence of outliers. The Mann–Whitney estimator (MW) was calculated as the effect size measure associated with the Wilcoxon–Mann–Whitney test.

Comparison groups	Placebo v Cerebrolysin
Number of subjects included in analysis	205
Analysis specification	Post-hoc
Analysis type	superiority ^[1]
P-value	≤ 0.05
Method	Wilcoxon (Mann-Whitney)
Parameter estimate	Mann-Whitney
Point estimate	0.7118

level	95 %
sides	2-sided
lower limit	0.6307
upper limit	0.7928

Notes:

[1] - The null and alternative hypotheses for the comparison of the effects of Cerebrolysin versus placebo can be formulated as follows (superiority test; T: test treatment; C: control treatment):

Null hypothesis H_0 : $MWTC \leq 0.50$

Alternative hypothesis H_A : $MWTC > 0.50$

The traditional benchmark values for the MW are 0.29 (large inferiority), 0.36 (medium inferiority), 0.44 (small inferiority), 0.50 (equality), 0.56 (small superiority), 0.64 (medium superiority), and 0.71 (large superiority).

Post-hoc: Gait velocity change from baseline to day 90 - nonparametric re-analysis

End point title	Gait velocity change from baseline to day 90 - nonparametric re-analysis
-----------------	--

End point description:

Gait velocity is measured as the time taken to walk the middle 8 meters of 10 meters and is timed by a

chronometer. The first and last meters, considered respectively warm-up and the deceleration phases, are not included in the calculation. Participants begin the GV test on the word "go" and are instructed to "walk at a comfortable and secure pace." Each participant performs the task twice, with the final score being the time in seconds of the quicker of the two timed trials.

Post-hoc: 9-Hole Peg Test change from baseline to day 90 - nonparametric re-analysis

End point title	9-Hole Peg Test change from baseline to day 90 - nonparametric re-analysis
-----------------	--

End point description:

The 9-HPT is a brief, standardized, quantitative test of upper extremity function. Both the dominant and non-dominant hands are tested twice. The patient is seated at a table with a small, shallow container holding nine pegs and a wood or plastic block containing nine empty holes. On a start command when a stopwatch is started, the patient picks up the nine pegs one at a time as quickly as possible, puts them in the nine holes, and, once they are in the holes, removes them again as quickly as possible one at a time, replacing them into the shallow container. The total time to complete the task is recorded. Two consecutive trials with the dominant hand are immediately followed by two consecutive trials with the non-dominant hand.

Post-hoc: Line cancellation test change from baseline to day 90 - nonparametric re-analysis

End point title	Line cancellation test change from baseline to day 90 - nonparametric re-analysis
-----------------	---

End point description:

At the line cancellation test (score range from 0 to 36 points), subjects are presented with a single sheet of paper on which 6 lines in varying orientations are drawn, 18 on each side. They are instructed to make a mark through all of the lines. Left- sided neglect was indicated by a failure to mark more lines on the left side than on the right. Degree of neglect is assessed by the proportion of lines omitted relative to the total number of lines. The line cancellation test sheet is divided into right and left portions and a right and then a left correct answer rates are analyzed.

Post-hoc: Gap detection test change from baseline to day 90 - nonparametric re-analysis

End point title	Gap detection test change from baseline to day 90 - nonparametric re-analysis
-----------------	---

End point description:

In the gap-detection test, twenty circles and forty pseudo-circles, each with a diameter of 15 mm, are drawn in a random manner on a sheet of white paper (29.7 x 42 cm) and are arranged evenly on either side of the vertical midline of the paper. Half of the pseudo-circles have a missing portion on the right side, and the rest have a missing portion on the left side. The patient is instructed to circle every complete circle and to cross out every incomplete circle with a pen held in the hand. To investigate neglect, the total number of figures correctly circled or crossed out is calculated for the left and right side of the stimulus sheet (body-centered neglect) and with respect to the three types of circles (stimulus-centered neglect).

Post-hoc: Geriatric Depression Scale change from baseline to day 90 - nonparametric re-analysis

End point title	Geriatric Depression Scale change from baseline to day 90 - nonparametric re-analysis
-----------------	---

End point description:

The Geriatric Depression Scale (GDS) is a 30-item self-report assessment designed specifically to identify depression in the elderly. The items may be answered yes or no, which is thought to be simpler than scales that use a five-category response set. It is generally recommended as a routine part of a comprehensive geriatric assessment. One point is assigned to each answer and corresponds to a scoring grid. A score of 10 or 11 or lower is the usual threshold to separate depressed from nondepressed patients.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Baseline to day 90.

Adverse event reporting additional description:

At each visit, AEs were documented and evaluated in terms of nature, date and time of onset, duration, severity, causality, action taken, outcome, and seriousness.

Patients with AEs were followed up until the event has subsided, the condition was considered medically stable, or the patient was no longer available to follow-up.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
08 July 2008	Amendment 1 / Study protocol V2.0: <ul style="list-style-type: none">- inclusion of further study sites- increase of sample size
02 September 2008	Amendment 2 / Study protocol V2.1: <ul style="list-style-type: none">- change of study biometrician- revision of the statistics section- change of inclusion criterion 2
21 November 2008	Amendment 3 / Study protocol V2.2: <ul style="list-style-type: none">- re-change of inclusion criterion 2- correction of time windows for visits 3, 4, 5;- adjustment of discontinuation criteria and action taken/outcome- inclusion of further study sites- change of sponsor's company name
15 April 2009	Amendment 4 / Study Protocol V2.3: <ul style="list-style-type: none">- inclusion of further study sites- update of sample size calculation- increase of sample size- update of study timelines- changes in packaging and preparation of study drug
12 November 2009	Amendment 5 / Study protocol V2.4 <ul style="list-style-type: none">- change of sponsor's company name- update of study timelines- amended information on the Gap Detection Test
10 June 2010	Amendment 6 / Study protocol V2.5 <ul style="list-style-type: none">- change of sponsor's company address and phone number- change of study safety officer- update of study medication label- correction of information on NIHSS

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
