General information about the trial

Main objective of the trial:

The purpose of this study is to determine whether apixaban is more effective than acetylsalicylic acid in the prevention of strokes associated with subjects with atrial fibrillation. The safety of this treatment was also studied.

Three participants were missing age information from all study demographic tables, with no clear explanation about why data was missing. Because the system does not allow us to note missing information, the three participants of unknown age were added to the "Elderly (From 65-84 years)" age category.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization Good Clinical Practice Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total 6421 subjects were enrolled in the study. Of these, 5598 were randomized (2807 to apixaban and 2791 to acetylsalicylic acid). Most (435) of the subjects who were not randomized (823) no longer met study criteria. Of those randomized, 5578 received treatment (2798 with apixaban, and 2780 with acetylsalicylic acid).

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

On May 28, 2010, after a planned interim analysis for efficacy, the Data Monitoring Committee recommended early termination due to apixaban's superior efficacy over ASA, with an acceptable safety profile. The open-label phase is ongoing.
