Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 October 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	31 October 2014
Global end of trial reached?	Yes
Global end of trial date	26 January 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The study addresses the following principal research questions (PRQ):

- (1) Are clinical management and aripiprazole combined (CM+ARI) more effective in PAR than CM and placebo combined (CM+PL)?
- (2) Is CBT more effective in PAR than CM+PL?
- (3) Is CBT not less effective in PAR than CM+ARI?

If PRQ 1-3 will be answered positively, there will be substantial empirical evidence for the prevention of first-episode psychosis.

The major motivation for the study is to answer PRQ 1, 2 and 3 regarding the primary aim of prevention of first-episode psychosis, the "delay or prevention of transition to psychosis".

Protection of trial subjects:

Assessment of safety: death, suicidal behaviour and severe depressive symptom exacerbation, pharmacological side effects

Background therapy:

Citalopram or escitalopram were the preferred antidepressive drugs. Lorazepam (maximum 7,5mg/d), zopiclon (maximum 15 mg/d), and chloral hydrate (maximum 1000 mg/d) were allowed to use for agitation and/or insomnia. Propranolol hydrochloride was allowed to treat akathisia. Biperiden up to 6 mg/day, was allowed to treat extrapyramidal symptoms.

Evidence for comparator:

Many authors claimed a need for methodological sound collaborative large scale randomized controlled trials (RCTs) in the clinical high risk for first episode psychosis population (CHR) involving strategies which have been found to have preventive potential in CHR (e. g. Heinssen et al., 2003; McGorry et al., 2004; Marshall and Lockwood, 2004; Olsen and Rosenbaum, 2005).

Aripiprazole (ARI) was chosen as antipsychotic agent because of its partial dopamine D2 and 5-HT1A receptor agonist and 5-HT2A receptor antagonist activity, which was postulated to be effective on schizophrenia positive and negative symptoms as well as on cognitive deficits while at the same time causing little extrapyramidal side effects, prolactin plasma level elevations and weight gain. The efficacy of ARI has been evaluated with regard to negative symptoms and depression as well as to positive symptoms. ARI is as effective as other antipsychotics combined with good tolerability, especially with regard to hyperprolactinaemia, sedation, weight gain, for diabetes mellitus, electrocardiographic disturbances and extrapyramidal symptoms (Lieberman, 2004; El-Sayeh and Morganti, 2006). First pilot evaluations in CHR demonstrated a good efficacy and tolerability of the compound (Woods 2006).

Cognitive Behavioral Therapy (CBT): There are two reasons to include this condition in the study: (a) evidence for superiority of antipsychotic agents and CBT when compared with unspecific conditions is equivocal so far. (b) CBT in PAR may have ethical, acceptance and compliance advantages.

Actual start date of recruitment	01 April 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 280
Worldwide total number of subjects	280
EEA total number of subjects	280

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	280
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Recruitment started on 01.04.2008 and ended on 31.10.2013.

The trial was conducted at eleven early detection and intervention centers located at the departments of psychiatry and psychotherapy of the Universities of Cologne, Aachen, Berlin, Bochum, Bonn, Dresden, Düsseldorf, Göttingen, Hamburg, Heidelberg (Medical Faculty Mannheim), and Munich.

Pre-assignment

Screening details:

3004 help-seeking individuals were screened with a checklist. Those who met the threshold checklist criteria and fulfilled no exclusion criteria underwent an assessment in terms of inclusion criteria: 18-49 years old, verbal IQ >70 meeting: Ultra high risk for psychosis criteria and/or basic symptoms cognitive disturbances criteria.

Period 1

Period 1 title	Randomization (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Clinical management (CM) and aripiprazole (ARI)

Arm description:

Clinical management and low dose of aripiprazole.

Arm type	Experimental
Investigational medicinal product name	Aripiprazole
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

The initial dose of aripiprazole was 2 mg in the first week, 2–5 mg in the second week, and 2–10 mg in the third week. After that, it could be dosed to a maximum of 15 mg. Bristol-Meyers Squibb USA manufactured the aripiprazole and matching placebo.

Arm title	Clinical management (CM) and placebo (PL)
------------------	---

Arm description:

Clinical management and placebo. The placebo was matching aripiprazole.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

The packaging, appearance, color, and taste of the aripiprazole and placebo tablets were identical to verum.

Arm title	Cognitive Behavioral Therapy (CBT)
------------------	------------------------------------

Arm description:

Cognitive behavioral therapy adapted to the needs of individuals at clinical high risk for first-episode

psychosis as detailed by a manual developed by Bechdolf et al.

Arm type	Experimental
Investigational medicinal product name	Cognitive behavioral therapy
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Not assigned
Routes of administration	Other use

Dosage and administration details:

CBT included a maximum of 30 individual sessions of up to 50 minutes over 52 weeks and was provided using a manual developed by Bechdolf et al.

Reporting groups

Reporting group title	Clinical management (CM) and aripiprazole (ARI)
-----------------------	---

Reporting group description:

CM was provided in addition to ARI or PLC and comprised a maximum of 21 sessions in the treatment phase of 52 weeks: weekly in the first four weeks, biweekly in the next 20 weeks and every fourth week over the following 28 weeks. The initial session lasted up to 60 minutes; the following sessions ranged from 20 to 30 minutes.

The initial dose of Aripiprazole (ARI) was 2 mg in the first week, 2-5 mg in the second week, and 2-10 mg in the third week, which could be dosed to a maximum of 15 mg thereafter. In accordance with the literature on people at risk, the overall dose range is lower (from 5 to 15 milligrams per day) as compared to first episode psychosis patients.

Reporting group title	Clinical management (CM) and placebo (PL)
-----------------------	---

Reporting group description:

CM was provided in addition to ARI or PLC and comprised a maximum of 21 sessions in the treatment phase of 52 weeks: weekly in the first four weeks, biweekly in the next 20 weeks and every fourth week over the following 28 weeks. The initial session lasted up to 60 minutes; the following sessions ranged from 20 to 30 minutes.

Aripiprazole matching placebo.

Reporting group title	Cognitive Behavioral Therapy (CBT)
-----------------------	------------------------------------

Reporting group description:

CBT included a total maximum of 30 individual sessions up to 50 minutes in 12 months. CBT started with weekly appointments for the first four months, fortnightly over the next six months and monthly over the last two months. However, the frequency and duration of the sessions were flexible depending on the arrangement made between the individual clients and the therapists as well as on the mental state of individual clients. CBT was provided by a manual developed by Bechdolf et al.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 October 2007	<p>Amendment 01 approved by the Ethics Committee of the University of Cologne:</p> <p>The ethics committee of the University of Cologne made the following conditions for the initial approval of the trial protocol:</p> <ol style="list-style-type: none">1. Addition to the exclusion criteria: intended pregnancy during the study.2. Cardiovascular diseases should be included in the exclusion criteria, as hypersensitivity to aripiprazole administration must be expected.3. Exclusion criteria should be expanded to: The person concerned has not been committed to an institution by virtue of an order issued by judicial or administrative authorities.4. The wording concerning the termination of the study in the case of suicide or SAEs should be clarified (e.g. by stating rates) or deleted, as this is already included under "safety reasons".5. Correct that during the visits, not only adverse Reactions but also adverse events are documented.6. Even if allergic reactions to placebo cannot be ruled out, they should not be considered "expected" but treated as SUSAR if necessary.7. We assume that by and large patients will be in the normal range of laboratory parameters. Therefore, any change of these parameters outside of the norm or changes in vital signs, (ECG), and changes that are otherwise considered clinically relevant by the investigator should be documented as an adverse event.8. On page 112, 'initials' should be deleted, since according to Section 4.6.6 a patient ID is assigned without initials, and the use of initials must be considered inadmissible under data protection law.
02 October 2008	<p>Amendment 02, Protocol version 6.1 approved by the Ethics Committee of the University of Cologne:</p> <p>Based on the experience gathered since the start of the PREVENT trial, the following changes were necessary to improve the feasibility of the study and increase its practicability. There was no change in the primary endpoints; the secondary endpoints were expanded.</p> <ol style="list-style-type: none">1. Physical examinations (ECG and laboratory parameters) were reduced to improved feasibility.2. Specifications of how blood samples are to be taken, processed and stored were added.3. Inclusion of the additional secondary endpoint "neurotrophic factors and oxidative stress as an add on to the study.

03 November 2011	<p>Amendment 03 Protocol version 8.0 approved by the Ethics Committee of the University of Cologne:</p> <ol style="list-style-type: none"> 1. Four additional centres were added to speed up recruitment. 2. Change of principal investigator in Düsseldorf was documented. 3. Inclusion criteria were revised from 40 to 49 years to accelerate recruitment. 4. Exclusion criteria were made more specific for better comprehensibility or were narrowed down in some points in order to include a larger group of patients (exclusion criterium: "current or past antipsychotic treatment for longer than 1 week: current or past antipsychotic treatment shorter than 1 week without a washout phase of at least 4 weeks "was changed to: "current or past antipsychotic treatment without a washout phase of at least 4 weeks. " 5. As the trial fell short of its recruitment goals, the time schedule was extended. 6. Contact details of principal investigators were updated. 7. Due to delays in the inclusion diagnostics, imaging (MRT) should be alternatively performed by CT. 8. The assessment frequency of the "Social Adjustment Scale" was reduced, since the scale refers to the period of the last three months on the one hand, and the survey dates were assessed as sufficient by the study director on the other.
07 May 2014	<p>Amendment 04 Protocol version 3.0 approved by the Ethics Committee of the University of Cologne:</p> <ol style="list-style-type: none"> 1. The trial did not meet its recruitment milestones. Thus, the power calculation was revised. The number of subjects to be included was reduced from 380 to 300. 2. Declining event rates were reported by studies in the field. Thus the primary endpoint "transition to psychosis" was expanded to "progression to psychosis". 3. In order to improve recruitment, two recruiting centres were added to the study. 4. Contact details were updated.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
