

## Clinical trial results:

### A Randomised, Placebo Controlled, Double-Blinded Comparative Study Evaluating the Effect of Ramipril on Urinary Protein Excretion in Maintenance Renal Transplant Patients Converted to Sirolimus Summary

EudraCT number	2007-001675-11
Trial protocol	FR ES BE AT DE IT HU PL
Global end of trial date	09 September 2013

#### Results information

Result version number	v1
This version publication date	08 July 2016
First version publication date	05 August 2015

#### Trial information

##### Trial identification

Sponsor protocol code	0468E5-4439
-----------------------	-------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT00502242
WHO universal trial number (UTN)	-
Other trial identifiers	Alias: B1741001

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	09 September 2013
Is this the analysis of the primary completion data?	Yes
Primary completion date	09 September 2013
Global end of trial reached?	Yes
Global end of trial date	09 September 2013
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To determine the efficacy of ramipril in preventing a urinary protein to creatinine ratio (U p/c) of 0.5 or greater following conversion to sirolimus (SRL) from a calcineurin inhibitor (CNI) (either tacrolimus [TAC] or cyclosporine [CsA]) in maintenance renal transplant patients.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles originating in or derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonisation (ICH) Good Clinical Practice (GCP) guidelines. In addition, all local regulatory requirements were followed, in particular, those affording greater protection to the safety of trial participants.

Background therapy:

In addition to SRL, all participants, at the discretion of the investigator, received background medication of corticosteroids and/or one of the following: mycophenolate mofetil (MMF), mycophenolate sodium (MPS), or azathioprine (AZA). Participants were permitted to switch between MMF, MPS, and AZA. Participants not receiving MMF, MPS, or AZA or who discontinued these agents received corticosteroids at a minimum of 2.5 milligrams (mg) per (/) day. Participants receiving corticosteroids were not permitted to undergo corticosteroid withdrawal following randomisation.

Evidence for comparator: -

Actual start date of recruitment	14 December 2007
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 2
Country: Number of subjects enrolled	Austria: 3
Country: Number of subjects enrolled	Germany: 4
Country: Number of subjects enrolled	Hungary: 8
Country: Number of subjects enrolled	Argentina: 26
Country: Number of subjects enrolled	Australia: 4
Country: Number of subjects enrolled	Brazil: 49
Country: Number of subjects enrolled	Canada: 19
Country: Number of subjects enrolled	Israel: 1
Country: Number of subjects enrolled	Mexico: 28
Country: Number of subjects enrolled	South Africa: 21
Country: Number of subjects enrolled	United States: 130

Worldwide total number of subjects	295
EEA total number of subjects	17

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	271
From 65 to 84 years	24
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

Screening was completed within 3 weeks before randomisation (from time informed consent form was signed to Day of Randomisation).

### Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Ramipril

Arm description:

Participants were receiving CsA or TAC and either MMF, MPS, or AZA or steroids dosed per centre's standard of care. Participants received ramipril, 5 or 10 mg/day orally (PO). 2-6 weeks after randomisation, participants stopped TAC or CsA (within 21 days of SRL initiation) and received SRL, PO, 2-4 mg/day (6-12 mg on Day 1 if TAC or CsA withdrawn abruptly) to achieve target trough levels (7-15 nanograms per millilitre [ng/mL] less than [ $<$ ]1 year post-transplant [PT], 5-15 ng/mL greater than or equal to [ $\geq$ ]1 year PT) for up to 52 weeks. Ramipril was increased to 10-20 mg if U p/c was  $\geq 0.5$ . If U p/c  $\geq 0.5$  persisted, losartan 50 mg/day was added; if U p/c  $\geq 0.5$  still persisted, losartan was increased to 100 mg/day. If then U p/c  $< 0.5$  was not maintained, study medication was discontinued and participant entered off-therapy phase of study.

Arm type	Experimental
Investigational medicinal product name	Ramipril
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

After randomisation, ramipril or placebo administration was initiated. For participants enrolled prior to implementation of Amendment 3, ramipril or placebo was initiated at 10 mg/day. For participants enrolled after implementation of Amendment 3, ramipril or placebo was initiated at 5 mg/day. If ramipril or placebo needed to be temporarily withheld but was resumed within the 4-week pre-SRL conversion phase, and the participant received a minimum of 10 consecutive days of ramipril or placebo therapy prior to SRL conversion the participant was permitted to be converted. If a participant was not able to resume ramipril or placebo therapy, the participant was dropped from the study and no further data was collected. Losartan rescue therapy was initiated at 50 mg/day and may have been titrated to 100 mg/day if the Up/c ratio was not maintained at  $< 0.5$  on 50 mg/day. All study medication doses given, were adjusted throughout the study based on the maintenance of targeted Up/c levels.

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Participants were receiving CsA or TAC and either MMF, MPS, or AZA or steroids dosed per centre's standard of care. Participants received double-blinded placebo, 1 capsule (5 or 10 mg/day), PO. 2-6 weeks after randomisation, participants stopped TAC or CsA (within 21 days of SRL initiation) and received SRL, PO, 2-4 mg/day (6-12 mg on Day 1 if TAC or CsA withdrawn abruptly) to achieve target trough levels (7-15 ng/mL  $< 1$  year PT, 5-15 ng/mL  $\geq 1$  year PT) for up to 52 weeks. Placebo dose was doubled if U p/c was  $\geq 0.5$ . If U p/c  $\geq 0.5$  persisted, losartan 50 mg/day was added; if U p/c  $\geq 0.5$  still persisted, losartan was increased to 100 mg/day. If then U p/c  $< 0.5$  was not maintained, study medication was discontinued and participant entered off-therapy phase of study.

Arm type	Placebo

Subject analysis set title	Pharmacokinetic analysis set
----------------------------	------------------------------

Subject analysis set type	Safety analysis
---------------------------	-----------------

#### Subject analysis set description:

C<sub>min,TN</sub> was determined for SRL using the area method for the intervals: 0-2 weeks, >2-4 weeks, >4-12 weeks, >12-24 weeks, >24-36 weeks and >36-52 weeks using the equation  $C_{min,TN} = AUC_{i-j}/(t_{j-i} - t_{i-i})$ , where AUC was the area under the concentration-time curve, i was the beginning of the interval and j was the end of the interval. C<sub>min,TN</sub> was calculated for participants who did not dropout of studies, but were missing concentrations at the interval endpoints by carrying the last observed concentration forward to the interval endpoint.

### Primary: Percentage of Participants who had Initiated Losartan Therapy at 52 Weeks Following Conversion to SRL

End point title	Percentage of Participants who had Initiated Losartan Therapy at 52 Weeks Following Conversion to SRL
-----------------	---

#### End point description:

The event for each participant was defined as the initiation of losartan while on SRL and ramipril/placebo combination therapy. Participants who started losartan prior to SRL administration were not counted as events. Percentage was estimated using Kaplan-Meier method for time to event data. Modified Intent to Treat (mITT) population: all participants in the safety population who took at least one dose of SRL.

End point type	Primary
----------------	---------

#### End point timeframe:

## Secondary: Percentage of Participants Who Discontinued SRL Therapy at 24 and 52 Weeks Following Conversion to SRL

End point title	Percentage of Participants Who Discontinued SRL Therapy at 24 and 52 Weeks Following Conversion to SRL
-----------------	--

End point description:

Defined as the percentage of participants who stop SRL (as test article) between the first day of SRL and either Week 24 or Week 52 following conversion to SRL. If a participant had a >14 day gap in SRL use, the stop date of SRL was the date of the last SRL use before it was re-initiated. Participants who early terminate SRL at Week 24 were defined as having SRL stop day less than or equal to ( $\leq$ ) Day 190 (selected as the midpoint between Weeks 24 and 30). Participants who early terminate SRL at Week 52 were defined as having SRL stop day  $\leq$  Day 337 (selected as the midpoint between Weeks 44 and 52). mITT population.

End point type	Secondary

<b>Statistical analysis title</b>	Baseline, Low SBP: $\leq 90$ mmHg
Comparison groups	Ramipril v Placebo
Number of subjects included in analysis	295
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.475 <sup>[63]</sup>
Method	Fisher exact

Notes:

[63] - 2-sided p-value; alpha=0.05 (unadjusted for multiplicity)

### Secondary: SRL Time Normalised Trough Concentration (Cmin,TN) by Time Interval

End point title	SRL Time Normalised Trough Concentration (Cmin,TN) by Time Interval
-----------------	---

End point description:

Cmin,TN was determined for SRL using the area method for the intervals: 0–2 weeks, >2–4 weeks, >4–12 weeks, >12–24 weeks, >24–36 weeks and >36–52 weeks using the equation  $C_{min,TN} = AUC_{i-j}/(t_{i+1}-t_i)$ , where AUC was the area under the concentration-time curve, i was the beginning of the interval and j was the end of the interval. Cmin,TN was calculated for participants who did not dropout of studies, but were missing concentrations at the interval endpoints by carrying the last observed concentration forward to the interval endpoint. Safety population; n=number of participants assessed for the specified parameter for the given time interval; only participants dosed throughout the interval were included.

End point type	Secondary
----------------	-----------

End point timeframe:

From Day 1 of SRL conversion to 52 weeks after conversion

End point values	Pharmacokinetic analysis set

24 weeks postconversion	8 (4.2 to 13.3)	0.8 (0.1 to 4)		
52 weeks postconversion	9.5 (5.3 to 15.1)	3.2 (1.1 to 7.5)		

## Statistical analyses

No statistical analyses for this end point

## Secondary: Number of Participants with BCAR by Severity of First BCAR

End point title	Number of Participants with BCAR by Severity of First BCAR
End point description:	
Severity was summarised by type (antibody versus T-cell) and by phase: post-SRL (where both on-therapy and off-therapy events are included) and post-SRL (on-therapy). BCAR was categorised using Banff criteria as antibody-mediated (AM) or T-cell. AM BCAR severity was graded as Grade I (mild), Grade II (moderate [mod]), and Grade III (severe). T-cell BCAR severity was graded as 'Grade Ia, Ib (mild), Grade IIa, IIb (mod), and Grade III (severe). If a participant had both T-cell BCAR and AM BCAR on the first rejection, the participant was counted in each category. For participants with T-cell BCAR (post-SRL and post-SRL On -Therapy) the p-value could not be calculated and all events were mild in severity. mITT population; only participants with BCAR were included in the analysis.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Randomisation through Week 52 following conversion to SRL

Adverse event reporting additional description:

The same event may appear as both an adverse event (AE) and a serious AE (SAE). However, what is presented are distinct events. An event may be categorised as serious in one participant and as non-serious in another participant, or one participant may have experienced both a serious and non-serious event during the study.

Assessment type	Non-systematic
-----------------	----------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	16.0
--------------------	------

### Reporting groups

Reporting group title	Ramipril
-----------------------	----------

Reporting group description:

Participants were receiving CsA or TAC and either mycophenolate mofetil (MMF), mycophenolate sodium (MPS), or azathioprine (AZA) or steroids dosed per centre's standard of care. Participants received ramipril, 5 or 10 milligrams (mg) per (/) day orally (PO). 2-6 weeks after randomisation, participants stopped TAC or CsA (within 21 days of SRL initiation) and received SRL, PO, 2-4 mg/day (6-12 mg on Day 1 if TAC or CsA withdrawn abruptly) to achieve target trough levels (7-15 nanograms per millilitre [ng/mL] less than [ $<$ ]1 year post-transplant [PT], 5-15 ng/mL greater than or equal to [ $\geq$ ]1 year PT) for up to 52 weeks. Ramipril was increased to 10-20 mg if U p/c was  $\geq 0.5$ . If U p/c  $\geq 0.5$  persisted, losartan 50 mg/day was added; if U p/c  $\geq 0.5$  still persisted, losartan was increased to 100 mg/day. If then U p/c  $< 0.5$  was not maintained, study medication was discontinued and participant entered off-therapy phase of study.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants were receiving CsA or TAC and either MMF, MPS, or AZA or steroids dosed per centre's standard of care. Participants received double-blinded placebo, 1 capsule (5 or 10 mg/day), PO. 2-6 weeks after randomisation, participants stopped TAC or CsA (within 21 days of SRL initiation) and received SRL, PO, 2-4 mg/day (6-12 mg on Day 1 if TAC or CsA withdrawn abruptly) to achieve target trough levels (7-15 ng/mL  $< 1$  year PT, 5-15 ng/mL  $\geq 1$  year PT) for up to 52 weeks. Placebo dose was doubled if U p/c was  $\geq 0.5$ . If U p/c  $\geq 0.5$  persisted, losartan 50 mg/day was added; if U p/c  $\geq 0.5$  still persisted, losartan was increased to 100 mg/day. If then U p/c  $< 0.5$  was not maintained, study medication was discontinued and participant entered off-therapy phase of study.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
17 September 2007	<ul style="list-style-type: none"><li>• Phase 1 (Pre-SRL conversion): 2 to 4 weeks of therapy with ramipril or placebo (2 weeks were added).</li><li>• Revised the total duration of the study to be approximately 160 (from 164) weeks.</li></ul>
03 September 2008	<ul style="list-style-type: none"><li>• Phase 1 Pre-SRL conversion was shortened to a minimum of 2 weeks up to a maximum of 4 weeks to decrease the amount of required in-clinic visits and allow participants to convert to SRL earlier while still performing all safety assessments.</li><li>• Phase 2: added in MPS and editorial changes.</li><li>• Formatting was changed and dosage amount of MMF, MPS, and AZA was clarified.</li><li>• Time after transplant was changed from 6 to 60 months to 3 to 60 months.</li><li>• The 4-weeks post randomisation period before SRL conversion was shortened to 2 to 4 weeks. Investigators then had the option to convert participants, if eligible for SRL conversion, at 2 weeks post randomisation rather than waiting until 4 weeks. The 4-week post-randomisation visit remained as an optional visit in the protocol.</li><li>• Inclusion criteria number 4 was modified to include participants as early as 3 months post-transplant.</li><li>• Ualb/c ratios stated in the exclusion criteria and relating to dose changes were removed from the protocol.</li><li>• Target blood pressure was clarified to state &lt;140/90 mm Hg throughout the protocol.</li><li>• Angioedema was added as a safety endpoint and was considered an AE with special circumstances and was to be reported as a SAE for the duration of the study.</li><li>• Day of randomisation and Day 1 of conversion may not have been required in centre visits if approved by the Independent Ethics Committee (IEC) or Institutional Review Board (IRB) and if appropriate arrangements were made for data collection and supply of study drug to participants.</li><li>• Visits at Weeks 4, 8, and 12 post-discontinuation (off-therapy) had the option to be performed locally as approved by the IEC/IRB.</li><li>• Ualb/c ratios for purposes of participant eligibility as well as dosage adjustments were removed from the protocol (all eligibility and dose adjustment decisions were based on the urine protein to creatinine ratios). The Ualb/c data were collected and analysed but not reported back to the centre.</li></ul>

10 December 2008	<ul style="list-style-type: none"> <li>• Starting dose for ramipril and matching placebo lowered from 10 mg/day to 5 mg/day.</li> <li>• Enrolment period extended to 104 weeks.</li> <li>• Clarified participants can initiate conversion to SRL as late as 6 weeks following randomisation.</li> <li>• Participants who discontinued from assigned therapy once conversion to SRL began were followed for 52 weeks after initiation of conversion.</li> <li>• Clarified only women of child bearing potential required two methods of contraception when using MMF or MPS.</li> <li>• Updated Exclusion Criteria regarding prohibition of renin-angiotensin-aldosterone system blockade and of participants with Grade C Child-Pugh score.</li> <li>• Clarified dose reduction instructions regarding elevated serum creatinine, hyperkalaemia, hypotension, and hypertension applied to all participants. Hypertension was separated in its own section for clarity.</li> <li>• New SRL target trough levels determined by high-performance liquid chromatography. Notation that dose changes for the participants other immunosuppressive medications were based upon the new target SRL trough levels.</li> <li>• Changed study drug administration for off-therapy participants.</li> <li>• Clarified concomitant treatment for anaemia.</li> <li>• Changed information on concomitant use of insulin.</li> <li>• Clarified the definition of hypotension.</li> <li>• Updated definition of "off-therapy" participants.</li> <li>• Evaluation of hepatic impairment at screening was added.</li> <li>• Clarified utilisation of urine albumin to creatinine ratios.</li> <li>• Clarified timing for Day 1.</li> <li>• Added Week 24 and Week 52 post-SRL conversion visit.</li> <li>• Clarified AE follow-up for off-therapy participants and dropped participants; clarification of concomitant medication collection for off-therapy participants</li> <li>• Updated unblinding procedures.</li> <li>• Updated safety reporting.</li> <li>• Clarification of statistical methods.</li> <li>• Addition of secondary endpoint for evaluation of albumin to protein.</li> <li>• Addition of information on interim analysis.</li> <li>• Correction to statement of statistical power from 90% to 84%.</li> </ul>
26 October 2009	<ul style="list-style-type: none"> <li>• Updates to duration of participant participation and duration of study.</li> <li>• Updated exclusion criteria: Clarification to exclude planned systemic treatments with voriconazole, cisapride, or ketoconazole; haemoglobin criterion added to align with safety endpoint.</li> <li>• Clarification that participants with the following condition or characteristic at the visit immediately prior to the start of SRL were excluded from SRL conversion: Less than 10 consecutive days of treatment with ramipril or placebo therapy.</li> <li>• Based on feedback from the Food and Drug Administration, the interim analysis was removed.</li> <li>• Clarification regarding planned systemic treatment with voriconazole, cisapride, or ketoconazole. If a participant was receiving any of these medications before enrolment, use of the medication must have been discontinued before randomisation. If unplanned or unexpected use was deemed necessary by the investigator, further participation of the participant was discussed with the Medical Monitor.</li> <li>• Clarifications to: definitions of screen failures, dropped participants, and unblinding of participants.</li> <li>• Change in target SRL trough levels.</li> <li>• Clarifications to dose adjustments made for urine protein-to-creatinine ratio &gt;0.5; and U p/c testing between protocol required visits.</li> <li>• Clarification that the decreasing the dose or holding/discontinuing/withdrawing of losartan was considered a dose reduction and that there was a time limit to this dose reduction consistent with ramipril or placebo dose reductions.</li> <li>• Clarifications to the treatment of elevated serum creatinine, the recording and reporting of AEs and SAEs, and to medication error versus overdose.</li> </ul>

26 April 2010	<ul style="list-style-type: none"> <li>• The enrolment period was extended until the end of December 2010 (time from first participant enrolled to last participant enrolled).</li> <li>• Clarifications added: <ul style="list-style-type: none"> <li>- If treatment with SRL continued after a participant was discontinued from study treatment, this was collected in the case report form (CRF) on the immunosuppression off-therapy CRF page.</li> <li>- Ramipril or placebo and losartan dose adjustments due to a urine protein-to-creatinine ratio <math>\geq 0.5</math>. Wording added to help clarify the timing of when repeat U p/c testing was required.</li> </ul> </li> <li>• Previously Performed Biopsies (Data Safety Monitoring Board [DSMB] request): <ul style="list-style-type: none"> <li>- All kidney biopsies that were performed on participants prior to 22 Mar 2010, including those for suspected rejection, for other indications at the discretion of the investigator, or for site protocol biopsies, were collected upon obtaining participant consent.</li> <li>- These biopsies were read by a central pathologist who was blinded to treatment assignment.</li> </ul> </li> <li>• Mandatory Biopsies (DSMB request): <ul style="list-style-type: none"> <li>- Performed at selected centres only.</li> <li>- Read locally according to the updated Banff 1997 criteria.</li> <li>- All participants enrolled at the participating centres after the implementation of Amendment 5 were required to have biopsies.</li> <li>- Biopsies were required for all newly enrolled participants prior to the day of randomisation (performed prior to the first dose of ramipril or placebo).</li> <li>- Data from a biopsy performed within 12 weeks of randomisation was permitted to be used as the baseline except for biopsies performed at the time of implantation.</li> <li>- A repeat biopsy was also required at Week 8 post-SRL conversion (<math>\pm 4</math> weeks).</li> </ul> </li> </ul>
18 May 2010	<ul style="list-style-type: none"> <li>• A new visit was added at Week 44 Post-Conversion based on a recommendation made by the DSMB for an additional creatinine evaluation at 44 weeks post-SRL conversion.</li> <li>• The total volume of blood collected was increased from approximately 183 mL, to approximately 189 mL, dependent on the amount of time the participant on study.</li> </ul>
28 February 2011	<ul style="list-style-type: none"> <li>• Updated the number of participants to be enrolled; the screen failure rate and the pre conversion withdrawal rates were underestimated. Based on the current rate, approximately 440 participants were to be screened to achieve conversion targets.</li> <li>• Clarification that all participants, regardless if they are receiving lipid-lowering therapy, must have had fasting lipid levels below the exclusion criteria.</li> <li>• Enrolment timelines extended to allow complete enrolment of the study.</li> <li>• Addition of Hy's Law language. Changes included additional tests.</li> <li>• Revisions to the AE reporting section (replaced Wyeth AE and reporting sections with Pfizer sections).</li> <li>• There were 3 main changes for sites and study personnel: <ul style="list-style-type: none"> <li>- SAEs with a causal relationship to SRL were to be collected after participants discontinued early from assigned therapy.</li> <li>- Criteria were provided for assessing and reporting potential drug-induced liver toxicity (Hy's Law).</li> <li>- Criterion was provided for reporting exposure to SRL during pregnancy (exposure in-utero).</li> </ul> </li> </ul>

29 February 2012	<ul style="list-style-type: none"> <li>• Randomisation process for the study changed from the Wyeth randomisation system, CORE, to the Pfizer system, IMPALA.</li> <li>• For Turkey only, the study was changed to a Phase 3B study in order to address the Health Authority in Turkey's request that the phase of the protocol be changed.</li> <li>• Added exclusion criteria: Participants who were either pregnant or lactating at the time of screening. This change was made at the request of the Health Authority in Poland.</li> <li>• Changed the study procedure for the protocol: Per the request of the Ethics Committee in Israel, additional blood chemistry testing (for potassium) was added for the Week 1 post randomisation visit.</li> <li>• Per the Pfizer template for protocols, the change in terminology of events previously described as "Adverse Events with Special Circumstance" was changed to Medically Important Adverse Events. This change did not impact the reporting requirements; these events were viewed and defined in the protocol as medically important events and hence fell within the requirements for SAE reporting.</li> <li>• Changed as required per Pfizer template for protocol, including the addition of required specific text regarding exposure in utero, and additional clarification pertaining to cases that met or did not meet the criteria for Hy's law.</li> <li>• A new section was added to the protocol for medication error reporting. All medication errors events were to be reported regardless of whether or not they were accompanied by an AE and must have been documented accordingly on the medication error CRF.</li> <li>• A new section was added to the protocol for the DSMB; the operation of the Data Monitoring Committee and its interaction with the sponsor in terms of recommendations was stated in the protocol.</li> <li>• A new section was added to the protocol for the reporting of safety issue and serious breaches of the protocol or ICH GCP.</li> <li>• Extended study timelines to 5 years.</li> </ul>
14 February 2013	<ul style="list-style-type: none"> <li>• To reflect Pfizer's updated policy requirements, the following change/clarification to the protocol was provided to all participating sites: SAEs occurring to a participant after the active reporting period had ended should have been reported to the sponsor if the investigator became aware of them. At a minimum, all SAEs that the investigator believed had at least a reasonable possibility of being related to study drug were to be reported to the sponsor.</li> </ul>

Notes:

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

None reported
