Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	05 February 2010
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	31 December 2009
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to determine the effect of ataluren on ambulation.

Protection of trial subjects:

The study was conducted in accordance with the ethical principles that have their origins in the Declaration of Helsinki (revised version of Edinburgh, Scotland, 2000) and in conformance with the International Conference on Harmonisation (ICH) Good Clinical Practice (GCP) guidance documents.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	29 February 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 78
Country: Number of subjects enrolled	United Kingdom: 21
Country: Number of subjects enrolled	Italy: 13
Country: Number of subjects enrolled	Australia: 11
Country: Number of subjects enrolled	Germany: 11
Country: Number of subjects enrolled	Canada: 10
Country: Number of subjects enrolled	France: 8
Country: Number of subjects enrolled	Sweden: 8
Country: Number of subjects enrolled	Spain: 6
Country: Number of subjects enrolled	Belgium: 5
Country: Number of subjects enrolled	Israel: 3
Worldwide total number of subjects	174
EEA total number of subjects	72

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	156
Adolescents (12-17 years)	17
Adults (18-64 years)	1
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 185 participants were screened for eligibility, of which 11 participants did not meet entry criteria.

Pre-assignment

Screening details:

A total of 174 eligible participants were randomized in 1:1:1 ratio to receive either placebo, low-dose ataluren, or high-dose ataluren.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Carer, Assessor, Subject

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	High-Dose Ataluren
------------------	--------------------

Arm description:

Participants received ataluren suspension orally 3 times a day (TID), 20 milligrams/kilogram (mg/kg) at morning, 20 mg/kg at midday, and 40 mg/kg at evening (total daily dose 80 mg/kg) for 48 weeks.

Arm type	Experimental
Investigational medicinal product name	Ataluren
Investigational medicinal product code	PTC124
Other name	
Pharmaceutical forms	Granules for oral suspension
Routes of administration	Oral use

Dosage and administration details:

Ataluren was administered as per the dose and schedule specified in the respective arms.

Arm title	Low-Dose Ataluren
------------------	-------------------

Arm description:

Participants received ataluren suspension orally TID, 10 mg/kg at morning, 10 mg/kg at midday, and 20 mg/kg at evening (total daily dose 40 mg/kg) for 48 weeks.

Arm type	Experimental
Investigational medicinal product name	Ataluren
Investigational medicinal product code	PTC124
Other name	
Pharmaceutical forms	Granules for oral suspension
Routes of administration	Oral use

Dosage and administration details:

Ataluren was administered as per the dose and schedule specified in the respective arms.

Arm title	Placebo
------------------	---------

Arm description:

Participants received placebo matched to ataluren orally TID at morning, midday, and evening for 48 weeks.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	PTC124
Other name	
Pharmaceutical forms	Granules for oral suspension
Routes of administration	Oral use

Dosage and administration details:

Placebo matched to ataluren was administered as per the dose and schedule specified in the respective arms.

Number of subjects in period 1	High-Dose Ataluren	Low-Dose Ataluren	Placebo
Started	60	57	57
As-treated Population	60	57	57

Completed	59	57	57
Not completed	1	0	0
Protocol Noncompliance	1	-	-

Baseline characteristics

Reporting groups

Reporting group title	High-Dose Ataluren
Reporting group description:	
Participants received ataluren suspension orally 3 times a day (TID), 20 milligrams/kilogram (mg/kg) at morning, 20 mg/kg at midday, and 40 mg/kg at evening (total daily dose 80 mg/kg) for 48 weeks.	
Reporting group title	Low-Dose Ataluren
Reporting group description:	
Participants received ataluren suspension orally TID, 10 mg/kg at morning, 10 mg/kg at midday, and 20 mg/kg at evening (total daily dose 40 mg/kg) for 48 weeks.	
Reporting group title	Placebo
Reporting group description:	
Participants received placebo matched to ataluren orally TID at morning, midday, and evening for 48 weeks.	

Reporting group values	High-Dose Ataluren	Low-Dose Ataluren	Placebo
Number of subjects	60	57	57
Age categorical			
Units: Subjects			

Age Continuous			
Units: years			
arithmetic mean	8.4	8.8	8.3
standard deviation	± 2.53	± 2.91	± 2.33
Sex: Female, Male			
Units: Subjects			
Female	0	0	0
Male	60	57	57
6-Minute Walk Distance (6MWD)			
The 6MWD test was performed in a 30-meters-long flat corridor, where the participant was instructed to walk as far as possible, back and forth around two cones, with the permission to slow down, rest, or stop if needed. Ambulation was assessed via the 6MWD test following standardized procedures by measuring the 6MWD in meters. Participants were not permitted to use assistive devices (walker, long leg braces, or short leg braces) during the 6MWD test.			
Units: meters			
arithmetic mean	358.2	350.0	359.6
standard deviation	± 103.97	± 97.55	± 87.67

Secondary: Change From Baseline in Mean Activity Period/Day/Visit at Week 48, as Assessed by Step Activity Monitoring (SAM)

End point title	Change From Baseline in Mean Activity Period/Day/Visit at Week 48, as Assessed by Step Activity Monitoring (SAM)
-----------------	--

End point description:

Participants were instructed to continue to wear SAM (a pedometer) for at least 9 consecutive days. SAM was used to record number of strides/minute following each visit. A stride is the leg motion that begins when foot with SAM leaves the floor and ends when same foot touches the floor again (a stride generally equals 2 steps). Mean obtained during Screening (Week -6 to -1) and following Week 1 visit were used as baseline data. For each day, an active period was defined as the first time after 3:00 AM that greater than (>) 2 strides/minute were recorded to the last time prior to midnight that >2 strides/minute were recorded. Days were deleted on which such an active period was less than (<) 50% of mean active period across all days for that participant's visit. ITT population included all participants who were randomized and received any study treatment; and had a valid baseline, and at least one valid post-baseline 6MWD value. Here, 'n'=participants evaluable at specified timepoint.

Secondary: Change From Baseline in Percentage of Time During the Active Period Spent at Low Activity (Less Than or Equal to [≤] 15 steps/minute), Medium Activity (16-30 steps/minute), and High Activity (Greater Than [>]30 Steps/minute) at Week 48

End point title	Change From Baseline in Percentage of Time During the Active Period Spent at Low Activity (Less Than or Equal to [≤] 15
-----------------	---

End point description:

Participants were instructed to continue to wear SAM (a pedometer) for at least 9 consecutive days. SAM was used to record number of strides/minute following each visit. A stride is the leg motion that begins when foot with SAM leaves the floor and ends when same foot touches the floor again (a stride generally equals 2 steps). Mean obtained during Screening (Week -6 to -1) and following Week 1 visit were used as baseline data. For each day, an active period was defined as the first time after 3:00 AM that greater than ($>$) 2 strides/minute were recorded to the last time prior to midnight that >2 strides/minute were recorded. Days were deleted on which such an active period was less than ($<$) 50% of mean active period across all days for that participant's visit. ITT population included all participants who were randomized and received any study treatment; and had a valid baseline, and at least one valid post-baseline 6MWD value. Here, 'n'=participants evaluable at specified timepoint.

Secondary: Change From Baseline in Number of Digits Recalled Forwards and Backwards on Digit Span Task at Week 48

End point title	Change From Baseline in Number of Digits Recalled Forwards and Backwards on Digit Span Task at Week 48
-----------------	--

End point description:

Basic attention and working memory was measured using the digit span task. A series of digits (0-9) were presented to the child in an auditory format only. The task had 2 parts; in the forward condition, the child was requested to repeat back the digits in the order they were presented and in the backward condition, he was requested to reverse the order of presentation. A raw score of the total number of correct responses was converted to an age-scaled-score (z-score) by subtracting the corresponding mean and dividing by the corresponding standard deviation of a reference population for that age. ITT population included all participants who were randomized and received any study treatment; and had a valid baseline, and at least one valid post-baseline 6MWD value. Here, 'n'=participants evaluable for this endpoint for specified categories.

Secondary: Change From Baseline in Heart Rate Before, During, and After Each 6MWT at Week 48, as Assessed by Heart Rate Monitoring With the Polar® RS400

End point title	Change From Baseline in Heart Rate Before, During, and After Each 6MWT at Week 48, as Assessed by Heart Rate Monitoring With the Polar® RS400
-----------------	---

End point description:

Heart rate was measured with a Polar RS400 heart rate monitor, which consists of a transmitter strap worn around the chest and a wristwatch receiver. Monitor produces a digital text file with 1 value per minute that represents mean heart rate for that minute. Mean heart rates values were collected prior to, during, and after the 6MWD. The participant rested for 5 minutes in a sitting position prior to the 6MWD, and the mean heart rate for the last minute of this rest period was collected and documented as the resting heart rate. During the 6MWT, the mean heart rate was collected and documented as the active heart rate. After completing the 6MWT and resting for 3 minutes, the mean heart rate for 1 minute was collected and documented as the recovery heart rate. ITT population included all participants who were randomized and received any study treatment; and had a valid baseline, and at least one valid post-baseline 6MWD value. Here, 'n'=participants evaluable for specified categories.

End point title	Percent Change From Pre-Treatment Visit (1 Week Prior to Baseline Visit) in Biceps Muscle Dystrophin Expression at Post-Treatment Visit (Week 36), as Determined by Immunofluorescence
-----------------	--

End point description:

Immunofluorescence evidence of a change in dystrophin expression on biceps muscle biopsy was defined as an increase in the staining of the sarcolemmal membrane with an antibody to the C-terminal portion of the dystrophin protein (excluding revertant fibers) between the pre-treatment (1 week prior to Baseline visit) and post-treatment (Week 36) biopsies. The biceps muscle was biopsied from one arm for confirmation of the absence or reduced levels of dystrophin prior to treatment initiation and from the other arm to assess for production of dystrophin post-treatment. As-treated population included all randomized participants who actually received any study treatment. Here, 'n' signifies participants evaluable for this endpoint at specified timepoint.

Other pre-specified: Percentage of Participants With Treatment-Emergent Adverse Events (AEs)

End point title	Percentage of Participants With Treatment-Emergent Adverse Events (AEs)
-----------------	---

End point description:

An AE was any untoward medical occurrence in a participant who received study drug without regard to possibility of causal relationship. Serious adverse event (SAE) was an AE resulting in any of the following outcomes or deemed significant for any other reason: death; initial or prolonged inpatient hospitalization; life-threatening experience (immediate risk of dying); persistent or significant disability/incapacity; congenital anomaly. AEs included both SAEs and non-serious AEs. Treatment-emergent adverse event (TEAE) was defined as an adverse event that occurred or worsened in the period extending from first dose of study drug to 6 weeks after the last dose of study drug. A summary of other non-serious AEs and all SAEs, regardless of causality is located in the 'Reported AE section'. As-treated population included all randomized participants who actually received any study treatment.

End point type	Other pre-specified
----------------	---------------------

End point timeframe:

Baseline up to Week 54

End point values	High-Dose Ataluren	Low-Dose Ataluren	Placebo	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	60	57	57	
Units: percentage of participants				
number (not applicable)	95.0	96.5	98.2	

Statistical analyses

No statistical analyses for this end point

Other pre-specified: Study Drug Compliance

End point title	Study Drug Compliance
-----------------	-----------------------

End point description:

Study drug compliance was assessed by participant daily diary and quantification of used and unused study drug. Compliance was assessed in terms of the percentage of drug actually taken relative to the amount that should have been taken during the study. As-treated population included all randomized participants who actually received any study treatment.

End point type	Other pre-specified
----------------	---------------------

End point timeframe:

Baseline to Week 48

End point values	High-Dose Ataluren	Low-Dose Ataluren	Placebo	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	60	57	57	
Units: percentage of drug				
median (full range (min-max))	97.87 (34.9 to 99.6)	97.03 (64.5 to 99.8)	97.74 (76.6 to 99.9)	

Statistical analyses

No statistical analyses for this end point

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Baseline up to 6 weeks after the last dose of study drug (Week 54)

Adverse event reporting additional description:

As-treated population included all randomized participants who actually received any study treatment.

Assessment type	Systematic

Reporting groups

Reporting group title	High-Dose Ataluren
-----------------------	--------------------

Reporting group description:

Participants received ataluren suspension orally TID, 20 mg/kg at morning, 20 mg/kg at midday, and 40 mg/kg at evening (total daily dose 80 mg/kg) for 48 weeks.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants received placebo matched to ataluren orally TID at morning, midday, and evening for 48 weeks.

Reporting group title	Low-Dose Ataluren
-----------------------	-------------------

Reporting group description:

Participants received ataluren suspension orally TID, 10 mg/kg at morning, 10 mg/kg at midday, and 20 mg/kg at evening (total daily dose 40 mg/kg) for 48 weeks.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
20 December 2007	The changes implemented with this amendment are: - Information resulting from in vivo general toxicology studies of ataluren dosing for one month in mice was updated; - Information resulting from in vitro studies of human cytochrome P450 inhibition and induction was updated.
28 April 2008	The changes implemented with this amendment are: - Clarified that muscle dystrophin levels may be absent or reduced in Duchenne/Becker muscular dystrophy (DBMD) participants; - Clarified the required phenotypic evidence of DBMD by 9 years of age to ensure the enrollment of only BMD participants with more severe disease presentation and thereby limit the potential for a ceiling effect associated with the study-related efficacy evaluations; - Removed plasma renin as a laboratory parameter for potential exclusion from the study; - Clarified the duration of the follow-up period (that is, 6 weeks) requiring the use of contraceptives for sexually active participants; - Clarified the information regarding the metabolism of losartan by CYP2C9; - Clarified that participants must not use assistive devices during the 6MWD; - Clarified that blood pressure values collected during the 6MWD were not to be reconciled with blood pressure values collected with vital signs; - Clarified the wording to describe the methods used by the participants to complete the timed-function test (TFT) for running or walking 10 meters and climbing/descending stairs; - Clarified the wording to describe the documentation of the active heart rate during the 6MWD; - Clarified the site adverse event reporting requirements and de-identification of submitted source documentation to facilitate appropriate reporting by the sites; - Added and clarified assessments of 6MWD variability for upward adaption of sample size if variability was higher than expected; - Added a sensitivity analysis to determine the influence of assigning siblings to the same treatment group on the primary analysis; - Clarified the time-to-event analyses with regards to censoring; - Added a definition of treatment-emergent adverse events to clarify the safety analysis; - Corrected the number of participants for the interim efficacy and safety analysis from 100 to 90 participants (completing at least 24 weeks of treatment).
27 October 2008	The changes implemented with this amendment are: - Updated the required screening laboratory values based on experience to date in the DBMD study population. Thus, this amendment modified the screening laboratory parameters to allow for the inclusion of participants with clinically insignificant laboratory abnormalities and avoid unnecessary participant blood collection for retesting; - Modified the safety monitoring parameters and actions to be taken consistent with the changes to the laboratory entry criteria. This change was made to avoid the burden of unnecessary blood collection to reassess clinically inconsequential Grade 1 laboratory findings in this pediatric study population; - Removed the table describing the safety profile of ataluren; - Addressed the need for additional language to be inserted into the informed consent document encouraging participants and parents/guardians to avoid discussion of study-related procedures and study drug except with medical professionals involved in the study or in the care of the participant.

04 March 2009	<p>The changes implemented with this amendment are: - Clarified that a participant is only required to walk for ≥ 75 meters during the 6MWD at Screening for the purpose of determining study eligibility, and that distances < 75 meters are allowed for subsequent 6MWTs; - Revised the analysis plan for data derived from the SAM based on input from experts, recent literature, and assessment of initial pre-treatment data; - Updated the baseline 6MWD stratification from < 270 meters and ≥ 270 meters to < 350 meters and ≥ 350 meters. Prior to study start, the estimated mean 6MWD for the study population was ~ 270 meters; however, early assessment of pre-treatment 6MWD data (including 47 participants at Screening and 20 participants at Baseline visit) showed a mean 6MWD of ~ 350-360 meters; - Clarified that an overdose of study drug is the administration of a study drug dose > 2 times the highest intended total daily dose level for this protocol; - Clarified the procedures for confirming Grade 1 or minor laboratory abnormalities; - Clarified that information regarding prior use of cardiac drugs for congestive heart failure (CHF) prophylaxis/treatment was also to be collected; - Clarified the parameters being measured for hematology laboratory assessments; - Clarified that not all muscle samples were to be processed and immunostained for various sarcoglycans and dystroglycan; rather, select samples may be assessed, as permitted by sample availability and observed dystrophin expression; - Revised the analysis plan for the 6MWD. Because the magnitudes of the changes in 6MWD were likely to be related to the baseline 6MWD, and because the MMRM was likely to have greater power than the repeated-measures analysis of covariance (RANOVA), the MMRM was to be used rather than the RANOVA.</p>
