

## Clinical trial results:

### A randomized phase III 2-arm trial of paclitaxel plus bevacizumab vs. capecitabine plus bevacizumab for the first-line treatment of HER2-negative locally recurrent or metastatic breast cancer

#### Summary

EudraCT number	2007-005828-32
Trial protocol	AT CZ HU LV SK BG
Global end of trial date	15 December 2014

#### Results information

Result version number	v1 (current)
This version publication date	08 November 2019
First version publication date	08 November 2019

#### Trial information

##### Trial identification

Sponsor protocol code	CECOG/BC 1.3.005
-----------------------	------------------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT00600340
WHO universal trial number (UTN)	-

Notes:

Notes:

##### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

---

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 September 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 September 2014
Global end of trial reached?	Yes
Global end of trial date	15 December 2014
Was the trial ended prematurely?	No

Notes:

---

## General information about the trial

Main objective of the trial:

To show non-inferiority of Arm B versus Arm A in terms of overall survival (OS). Overall survival is assessed as time from date of randomization until date of death.

Study Treatment, given until progression of disease, unacceptable toxicity or withdrawal of consent:

Arm A: Bevacizumab plus Paclitaxel

Arm B: Bevacizumab plus Capecitabine

Protection of trial subjects:

For patients who stopped chemotherapy or the companion drug for any reason before disease progression (e.g. toxicity), the chemotherapy or companion drug was given as monotherapy until disease progression. If toxicity required a dosing delay or interruption of paclitaxel or capecitabine of more than three weeks, the patient was withdrawn from study treatment for toxicity reasons, but continued with the companion drug.

In cases of a first occurrence of a serious bevacizumab-related toxicity (grade 3 or 4), bevacizumab treatment was temporarily (for a max of 6 weeks) suspended. Bevacizumab was permanently suspended for a second occurrence of a serious bevacizumab-related toxicity.

Additionally, any patient who experienced the following events permanently discontinued bevacizumab:

- Reversible Posterior Leucoencephalopathy Syndrome (RPLS)
- Grade 3/4 hemorrhagic/bleeding events
- Any grade of arterial thromboembolism
- Grade 4 hypertension (hypertensive crisis)
- Grade 4 proteinuria (nephrotic syndrome)
- Grade 3/4 left ventricular dysfunction (CHF)
- Any grade of Gastrointestinal perforation
- Any grade of Tracheo-esophageal fistula
- Any grade 4 non-gastrointestinal fistula
- Any grade of hypersensitivity/allergic reactions related to bevacizumab.

---

Background therapy: -

Evidence for comparator:

Results from a phase III trial (E2100) indicate that the addition of bevacizumab to first-line paclitaxel significantly improves PFS (hazard ratio 0.48 [95% CI: 0.39–0.59],  $p=0.0001$ , median 6.7 vs 13.3 months).

A phase III trial demonstrated that the addition of bevacizumab to capecitabine in heavily pretreated patients significantly improves response rate. In this trial, 462 heavily pre-treated patients were randomised to treatment with standard-dose single-agent capecitabine (1,250 mg/m<sup>2</sup> twice daily, days 1–14 every 21 days) or the same capecitabine regimen plus bevacizumab 15 mg/kg on day 1 every 21 days. The response rate was 20% with the combination versus 9% with single-agent capecitabine ( $p=0.001$ ). However, the significantly superior response rate did not translate into improved PFS (hazard ratio 0.98 [95% CI: 0.77–1.25],  $p=0.857$ ; median 4.9 vs. 4.2 months, respectively) or overall survival (median 15.1 vs 14.5 months, respectively).

The preliminary results of a single-arm phase II study of bevacizumab plus capecitabine in the first-line setting suggest that the combination is more active earlier in the disease course. In this study, patients received capecitabine 1,000 mg/m<sup>2</sup> administered twice-daily for 14 days followed by a 7-day rest period in combination with bevacizumab 15 mg/kg every 21 days. Grade 4 adverse events were rare and the only grade 3 toxicities occurring in >5% of patients were hand-foot syndrome (13%), pain (10%), fatigue (7%) and diarrhoea (6%). Interim results for the first part of this crossover study indicated that with a median follow-up of 12.9 months (range 0.5–20.7), the median Time to progression (TTP) for the Intent-to-treat population ( $n=106$ ) was 5.7 months (range 4.9–8.4) and 8.9 months (range 7.5–13.6) in the estrogen receptor (ER) positive patient population. Corresponding results for overall survival for the

ITT vs ER positive populations were 16.0+ months vs 16.6+ months, respectively.

Actual start date of recruitment	10 September 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	419
From 65 to 84 years	143
85 years and over	2

## Subject disposition

### Recruitment

Recruitment details:

A total of 604 patients were screened and 564 randomized between September 10, 2008 and August 30, 2010, in 51 sites in 12 countries (Austria: 9, Bosnia: 1, Bulgaria: 3, Croatia: 5, Czech Republic: 4, Hungary: 4, Israel: 5, Latvia: 2, Poland: 6, Romania: 5, Serbia: 3, Slovakia: 4).  
564 pats in ITT population, 561 in safety, 533 in per-protocol.

### Pre-assignment

Screening details:

604 patients were screened for eligibility, 40 of these were not randomized: 38 did not meet the inclusion criteria, 2 declined to participate.

### Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

### Arms

Are arms mutually exclusive?	Yes
Arm title	Arm A

Arm description:

Patients in this arm received a combination of bevacizumab plus paclitaxel in cycles of 28 days as first-line treatment. Treatment continued until first progression of disease (PD), unacceptable toxicity or withdrawal of patient's consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.

Bevacizumab 10mg/kg i.v., days 1 and 15, every 4 weeks

Paclitaxel 90mg/m<sup>2</sup>, days 1, 8 and 15, every 4 weeks

Arm type	Active comparator
Investigational medicinal product name	Bevacizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Bevacizumab dose of 10 mg/kg on days 1 and 15, every 4 weeks. Patient's weight at screening was used to determine the dose to be used for the duration of the study. In case of weight change by more than 10% during the study, the dose had to be recalculated. Bevacizumab was administered as an i.v. infusion initially over 90 minutes (following the administration of paclitaxel). If the first infusion was well tolerated, the second infusion could be delivered over a 60-minute period. If the 60-minute infusion was well tolerated, all subsequent infusions could be delivered over a 30-minute period.

Bevacizumab was to be stored at 2 to 8°C and was to be prepared by a healthcare professional using aseptic technique. Withdraw the necessary amount of bevacizumab and dilute with sodium chloride (0.9%) solution for injection, up to a total volume of 100 mL. For heavier patients receiving doses of 10 or 15 mg/kg, the dose might be made up to 200 or 250 mL with sodium Chloride (0.9%) solution.

Investigational medicinal product name	Paclitaxel
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Paclitaxel in dose of 90 mg/m<sup>2</sup> on days 1, 8 and 15, every 4 weeks. Obtained commercially in vials of 30 mg (5.0 mL) and 100 mg (16.7 mL) and supplied with solvent. This was further diluted in 0.9% Sodium Chloride Injection, USP, 5% Dextrose Injection, USP, 5% Dextrose and 0.9% Sodium Chloride Injection, USP or 5% Dextrose in Ringer's Injection to a final concentration of 0.3 to 1.2 mg/mL, prior to administration.

Recommended pretreatment with oral corticosteroids (such as dexametaxone), difenhidramina and H2 antagonists (such as ranitidine) to reduce the severity of hypersensitivity reactions. Paclitaxel was be administered as a 1-hour i.v. infusion before bevacizumab and with the appropriate co-medications.

<b>Arm title</b>	Arm B
Arm description:	
Patients in Arm B received combination treatment with bevacizumab plus capecitabine as first-line treatment in cycles of 21 days, until first progression of disease (PD), unacceptable toxicity or withdrawal of patient consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.	
Bevacizumab 15 mg/kg i.v. on day 1 every 3 weeks	
Capecitabine 1000 mg/m <sup>2</sup> twice-daily on days 1-14, every 3 weeks	
Arm type	Experimental
Investigational medicinal product name	Bevacizumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for infusion
Routes of administration	Intravenous use

**Dosage and administration details:**

Bevacizumab dose of 15 mg/kg on day 1, every 3 weeks. Patient's weight at screening was used to determine the dose to be used for the duration of the study. In case of weight change by more than 10% during the study, the dose had to be recalculated. Bevacizumab was administered as an i.v. infusion initially over 90 minutes (following the administration of paclitaxel). If the first infusion was well tolerated, the second infusion could be delivered over a 60-minute period. If the 60-minute infusion was well tolerated, all subsequent infusions could be delivered over a 30-minute period.

Bevacizumab was to be stored at 2 to 8°C and was to be prepared by a healthcare professional using aseptic technique. Withdraw the necessary amount of bevacizumab and dilute with sodium chloride (0.9%) solution for injection, up to a total volume of 100 mL. For heavier patients receiving doses of 10 or 15 mg/kg, the dose might be made up to 200 or 250 mL with sodium Chloride (0.9%) solution.

Investigational medicinal product name	Capecitabine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Coated tablet
Routes of administration	Oral use

**Dosage and administration details:**

Dose of twice-daily 1000 mg/m<sup>2</sup> on days 1-14, every 3 weeks. To be taken orally twice daily in equally divided doses morning and evening for a total daily dose of 2000 mg/m<sup>2</sup> on days 1-14, with the first dose occurring in the morning of day 1 and the last dose occurring on the evening of day 14 for a total of 28 doses. The morning and evening dose should be given approximately 12 hours apart, and taken within 30 minutes after the ingestion of food with approximately 200 mL of water, ideally after the breakfast and evening meal.

Patients who were 65 years of age or older had an initial 25% capecitabine dose reduction.

The daily dose was derived by determining the body surface area (BSA) from the nomogram in Appendix 5 of the study protocol. If body weight varied during the study, it was assumed that the body surface area would remain approximately constant (i.e. no dose adjustments for changes in body weight were done).

## End points

### End points reporting groups

Reporting group title	Arm A
Reporting group description:	
Patients in this arm received a combination of bevacizumab plus paclitaxel in cycles of 28 days as first-line treatment. Treatment continued until first progression of disease (PD), unacceptable toxicity or withdrawal of patient's consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.	
Bevacizumab 10mg/kg i.v., days 1 and 15, every 4 weeks	
Paclitaxel 90mg/m <sup>2</sup> , days 1, 8 and 15, every 4 weeks	
Reporting group title	Arm B
Reporting group description:	
Patients in Arm B received combination treatment with bevacizumab plus capecitabine as first-line treatment in cycles of 21 days, until first progression of disease (PD), unacceptable toxicity or withdrawal of patient consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.	
Bevacizumab 15 mg/kg i.v. on day 1 every 3 weeks	
Capecitabine 1000 mg/m <sup>2</sup> twice-daily on days 1-14, every 3 weeks	

### Primary: Overall Survival (PP population)

End point title	Overall Survival (PP population)
End point description:	
OS defined as time from randomization to date of death from any cause. Patients without recorded death were censored at the date the patient was last known to be alive. For the adjusted HR, the stratification factors at randomization were used.	
OS was analyzed at two looks, one interim look and the final analysis. Due to group sequential testing, the overall significance level $\alpha = 0.025$ was spent on both looks according to Lan-DeMets spending method with O'Brien-Fleming-type boundaries. Alpha spent at interim after 47% of information was 0.0010. Alpha spent at final analysis after 99% of information was 0.0250.	
End point type	Primary
End point timeframe:	
Median Overall Survival (OS), associated stratified Hazard Ratio(HR) (pre-specified primary endpoint) and unstratified HR (sensitivity analysis) assessed after a median observation time of 54.3 months in arm A and 55.7 months in arm B.	

End point values	Arm A	Arm B		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	266 <sup>[1]</sup>	265 <sup>[2]</sup>		
Units: months				
median (confidence interval 95%)	30.2 (25.6 to 32.6)	26.1 (22.3 to 29.0)		

Notes:

### Statistical analyses

<b>Statistical analysis title</b>	HR of Arm B vs. Arm A for OS (interim, stratified)
Statistical analysis description:	
Based on Cox proportional hazards model adjusted by stratification factors at randomization:	
1) estrogen and/or progesterone status (positive vs. other)	
2) country	
3) menopausal status (premenopausal or male <=50 years of age vs. postmenopausal or male >50 years of age)	
HR is the hazard rate of Arm B divided by hazard rate of Arm A.	
Comparison groups	Arm B v Arm A
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	= 0.1983 <sup>[3]</sup>
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.042
Confidence interval	
level	Other: 97.5 %
sides	1-sided
upper limit	1.689

Notes:

[3] - Based on approach using repeated confidence intervals, with one-sided 97.5% repeated confidence intervals

<b>Statistical analysis title</b>	HR of Arm B vs. Arm A for OS (final, stratified)
Statistical analysis description:	
Based on Cox proportional hazards model adjusted by stratification factors at randomization:	
1) estrogen and/or progesterone status (positive vs. other)	
2) country	
3) menopausal status (premenopausal or male <=50 years of age vs. postmenopausal or male >50 years of Age)	
HR is the hazard rate of Arm B divided by hazard rate of Arm A.	
Comparison groups	Arm B v Arm A
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	= 0.007 <sup>[4]</sup>
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.018
Confidence interval	
level	Other: 97.5 %
sides	1-sided
upper limit	1.261

Notes:

[4] - Based on approach using repeated confidence intervals, with one-sided 97.5% repeated confidence intervals. Non-inferiority margin was a HR of 1.33.

<b>Statistical analysis title</b>	HR of Arm B vs. Arm A for OS (interim, unstrat.)
Statistical analysis description:	
Based on unadjusted Cox proportional hazards model.	
HR is the hazard rate of Arm B divided by hazard rate of Arm A.	
Comparison groups	Arm B v Arm A

Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	= 0.2024 <sup>[5]</sup>
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.058
Confidence interval	
level	Other: 97.5 %
sides	1-sided
upper limit	1.674

Notes:

[5] - Based on approach using repeated confidence intervals, with one-sided 97.5% repeated confidence intervals. Non-inferiority margin was a HR of 1.33.

<b>Statistical analysis title</b>	HR of Arm B vs. Arm A for OS (final, unstratified)
-----------------------------------	--

Statistical analysis description:

Based on unadjusted Cox proportional hazards model.

HR is the hazard rate of Arm B divided by hazard rate of Arm A.

Comparison groups	Arm B v Arm A
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	= 0.0612 <sup>[6]</sup>
Method	Regression, Cox
Parameter estimate	Hazard ratio (HR)
Point estimate	1.134
Confidence interval	
level	Other: 97.5 %
sides	1-sided
upper limit	1.386

Notes:

[6] - Based on approach using repeated confidence intervals, with one-sided 97.5% repeated confidence intervals. Non-inferiority margin was a HR of 1.33.

<b>Statistical analysis title</b>	OR of objective response and CMH test (stratified)
Statistical analysis description:	
OR is the odds for objective response of Arm B divided by the odds for objective response of Arm A Based on Cochran-Mantel-Haenszel test adjusted by stratification factors at randomization:	
1) estrogen and/or progesterone status (positive vs. other)	
2) country	
3) menopausal status (premenopausal or male $\leq 50$ years of age vs. postmenopausal or male $> 50$ years of age)	
Comparison groups	Arm A v Arm B
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	superiority
P-value	$< 0.0001$
Method	Cochran-Mantel-Haenszel
Parameter estimate	Odds ratio (OR)
Point estimate	0.42
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.29
upper limit	0.6

<b>Statistical analysis title</b>	OR of disease control and CMH test (stratified)
Statistical analysis description:	
OR is the odds for disease control of Arm B divided by the odds for disease control of Arm A Based on Cochran-Mantel-Haenszel test adjusted by stratification factors at randomization:	
1) estrogen and/or progesterone status (positive vs. other)	
2) country	
3) menopausal status (premenopausal or male $\leq 50$ years of age vs. postmenopausal or male $> 50$ years of age)	
Comparison groups	Arm A v Arm B
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	superiority
P-value	$= 0.0003$
Method	Cochran-Mantel-Haenszel
Parameter estimate	Odds ratio (OR)
Point estimate	0.39

Confidence interval	
level	95 %
sides	2-sided
lower limit	0.24
upper limit	0.65

<b>Statistical analysis title</b>	Difference in ORR in Arm B vs. Arm A
Statistical analysis description:	
Difference calculated as ORR in Arm B minus ORR in Arm A	
Comparison groups	Arm A v Arm B
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	superiority
Parameter estimate	Risk difference (RD)
Point estimate	-21
Confidence interval	
level	95 %
sides	2-sided
lower limit	-30
upper limit	-13

<b>Statistical analysis title</b>	Difference in DCR in Arm B vs. Arm A
Statistical analysis description:	
Difference calculated as DCR in Arm B minus DCR in Arm A	
Comparison groups	Arm A v Arm B
Number of subjects included in analysis	531
Analysis specification	Pre-specified
Analysis type	superiority
Parameter estimate	Risk difference (RD)
Point estimate	-12
Confidence interval	
level	95 %

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Adverse events recording for a patient was started with the first dose of any of the study drugs until the 28-day post-treatment follow up visit. Pre-existing conditions which worsened during the study were reported as Adverse Events.

Adverse event reporting additional description:

After the 28-day follow up visit only new and ongoing serious adverse events considered to be related to study drug or protocol procedures were recorded by the investigator

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	15.1
--------------------	------

### Reporting groups

Reporting group title	Arm A
-----------------------	-------

Reporting group description:

Patients in this arm received a combination of bevacizumab plus paclitaxel in cycles of 28 days as first-line treatment. Treatment continued until first progression of disease (PD), unacceptable toxicity or withdrawal of patients consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.

Bevacizumab 10mg/kg i.v., days 1 and 15, every 4 weeks

Paclitaxel 90mg/m<sup>2</sup>, days 1, 8 and 15, every 4 weeks

The safety population comprised all patients randomized who received at least one dose of study medication. For the purpose of safety analyses, patients were included in the treatment groups of their actually received treatment. However, if patients received only one component of the assigned combination treatment (e.g. only paclitaxel in group A), then they were analyzed under the treatment group randomized.

Reporting group title	Arm B
-----------------------	-------

Reporting group description:

Patients in Arm B received combination treatment with bevacizumab plus capecitabine as first-line treatment in cycles of 21 days, until first progression of disease (PD), unacceptable toxicity or withdrawal of patient consent. For patients who stopped chemotherapy for any reason before PD, bevacizumab was to be given as monotherapy until PD.

Bevacizumab 15 mg/kg i.v. on day 1 every 3 weeks

Capecitabine 1000 mg/m<sup>2</sup> twice-daily on days 1-14, every 3 weeks

The safety population comprised all patients randomized who received at least one dose of study medication. For the purpose of safety analyses, patients were included in the treatment groups of their actually received treatment. However, if patients received only one component of the assigned combination treatment (e.g. only paclitaxel in group A), then they were analyzed under the treatment group randomized.

Oedema peripheral			

subjects affected / exposed	27 / 284 (9.51%)	11 / 277 (3.97%)	
occurrences (all)	28	13	
Pyrexia			
subjects affected / exposed	23 / 284 (8.10%)	17 / 277 (6.14%)	
occurrences (all)	27	20	
Gastrointestinal disorders			
Abdominal pain			
subjects affected / exposed	20 / 284 (7.04%)	18 / 277 (6.50%)	
occurrences (all)	26	21	
Abdominal pain upper			
subjects affected / exposed	18 / 284 (6.34%)	14 / 277 (5.05%)	
occurrences (all)	24	17	
Constipation			
subjects affected / exposed	27 / 284 (9.51%)	25 / 277 (9.03%)	
occurrences (all)	32	32	
Diarrhoea			
subjects affected / exposed	58 / 284 (20.42%)	59 / 277 (21.30%)	
occurrences (all)	83	83	
Dyspepsia			
subjects affected / exposed	17 / 284 (5.99%)	15 / 277 (5.42%)	
occurrences (all)	24	17	
Nausea			
subjects affected / exposed	57 / 284 (20.07%)	70 / 277 (25.27%)	
occurrences (all)	82	94	
Stomatitis			
subjects affected / exposed	22 / 284 (7.75%)	20 / 277 (7.22%)	
occurrences (all)	27	24	
Vomiting			
subjects affected / exposed	29 / 284 (10.21%)	34 / 277 (12.27%)	
occurrences (all)	40	46	
Hepatobiliary disorders			
Hyperbilirubinaemia			
subjects affected / exposed	3 / 284 (1.06%)	16 / 277 (5.78%)	
occurrences (all)	3	18	
Respiratory, thoracic and mediastinal disorders			

Cough subjects affected / exposed occurrences (all)	32 / 284 (11.27%) 37	20 / 277 (7.22%) 22	
Dysphonia subjects affected / exposed occurrences (all)	35 / 284 (12.32%) 37	10 / 277 (3.61%) 11	
Dyspnoea subjects affected / exposed occurrences (all)	32 / 284 (11.27%) 39	24 / 277 (8.66%) 27	
Epistaxis subjects affected / exposed occurrences (all)	89 / 284 (31.34%) 122	39 / 277 (14.08%) 46	
Skin and subcutaneous tissue disorders			
Alopecia subjects affected / exposed occurrences (all)	87 / 284 (30.63%) 88	5 / 277 (1.81%) 5	
Nail disorder subjects affected / exposed occurrences (all)	48 / 284 (16.90%) 50	10 / 277 (3.61%) 10	
Palmar-plantar erythrodysaesthesia syndrome subjects affected / exposed occurrences (all)	8 / 284 (2.82%) 8	155 / 277 (55.96%) 197	
Rash subjects affected / exposed occurrences (all)	17 / 284 (5.99%) 20	11 / 277 (3.97%) 14	
Renal and urinary disorders			
Proteinuria subjects affected / exposed occurrences (all)	10 / 284 (3.52%) 13	16 / 277 (5.78%) 16	
Musculoskeletal and connective tissue disorders			
Arthralgia subjects affected / exposed occurrences (all)	30 / 284 (10.56%) 58	18 / 277 (6.50%) 20	
Back pain subjects affected / exposed occurrences (all)	27 / 284 (9.51%) 35	29 / 277 (10.47%) 29	

Bone pain			
subjects affected / exposed	28 / 284 (9.86%)	29 / 277 (10.47%)	
occurrences (all)	33	31	
Musculoskeletal pain			
subjects affected / exposed	3 / 284 (1.06%)	14 / 277 (5.05%)	
occurrences (all)	5	15	
Myalgia			
subjects affected / exposed	20 / 284 (7.04%)	9 / 277 (3.25%)	
occurrences (all)	26	9	
Pain in extremity			
subjects affected / exposed	25 / 284 (8.80%)	24 / 277 (8.66%)	
occurrences (all)	32	28	
Infections and infestations			
Urinary tract infection			
subjects affected / exposed	24 / 284 (8.45%)	14 / 277 (5.05%)	
occurrences (all)	29	18	
Metabolism and nutrition disorders			
Decreased appetite			
subjects affected / exposed	35 / 284 (12.32%)	33 / 277 (11.91%)	
occurrences (all)	38	38	

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
