

Clinical trial results:

Safety and efficacy of subcutaneous (SC) administration of Clinimix N9G15E in elderly patients at risk for malnutrition, at a dose of 1 liter infused over 12 hours for 7 to 10 consecutive days. A prospective, multicentre, randomized, open-label, non-inferiority, controlled phase III B trial carried out in parallel groups: subcutaneous versus peripheral intravenous administration.

Summary

EudraCT number	2007-006153-31

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	09 April 2010
Is this the analysis of the primary completion data?	Yes
Primary completion date	09 April 2010
Global end of trial reached?	Yes
Global end of trial date	09 April 2010
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to demonstrate that the SC administration of 1 liter of Clinimix N9G15E is non-inferior to the peripheral IV administration of 1 liter of Clinimix N9g15E in terms of local side effects. The secondary objective was to assess safety and efficacy in terms of patients' nutritional parameters, clinical outcomes, and hydration status.

Protection of trial subjects:

A patient could withdraw consent at any time for any reason. Patients were discontinued from the study if any of the following occurred during the course of the study:

- Patient required enteral or other parenteral administration.
- Patient or patient's legal authorized representative withdrew consent.
- Patient enrolled in any other investigational study.
- Onset of any serious or life threatening adverse event requiring discontinuation of study treatment.
- Investigator's decision.
- In case of the need for a second administration route switch.
- Patient required therapeutic anticoagulation after enrollment in the study.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 July 2008
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	France: 120
Worldwide total number of subjects	120
EEA total number of subjects	120

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	100
85 years and over	20

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

The study population (geriatric) chosen represented one population with difficult venous access and where SC hydration has been effective. The population contained patients with many different disorders. Other populations with difficult venous access may benefit from the therapy (the study was not meant to be exclusive of other populations).

Period 1

Period 1 title	Overall (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	SC Treatment

Arm description:

Subcutaneous (SC) Treatment of Clinimix N9G15E at a dose of 1 liter was infused subcutaneously over 12 hours for at least 7 and up to 10 consecutive days. Infusion sites included abdominal area, thighs, back and chest and were to be changed after administration of each 1 liter bag. Subcutaneous infusions were administered with a 21 to 25 G butterfly needle or catheter.

Arm type	Experimental
Investigational medicinal product name	Clinimix N9G15E Subcutaneous
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Subcutaneous use

Dosage and administration details:

The Clinimix N9G15E 1 L bag contained 27.5 g amino acids with electrolytes (Na, K, Ca, Mg, and PO₄) and 75 g glucose, in separate chambers, providing a total of 410 kcal/L. The final osmolarity (after mixing) was 845 mOsm/L. All 1000 mL were planned to be infused over 12 hours, resulting in a rate of infusion of approximately 83 to 84 mL/hour, not exceeding a rate of 3 mL/kg/hour.

Arm title	IV Treatment
------------------	--------------

Arm description:

Intravenous (IV) Treatment of Clinimix N9G15E at a dose of 1 liter was infused via peripheral IV over 12 hours for at least 7 and up to 10 consecutive days. Peripheral IV drips were to be changed by the local implementation of the local Comité de Liaison en Alimentation et Nutrition (CLAN) recommendations. The peripheral IV lines used for administration of Clinimix were to be used only for administration of the study test product. After administration of the final dose of test product, the peripheral IV line was to be removed and the injection site was not to be used for 48 hours.

Arm type	Active comparator
Investigational medicinal product name	Clinimix N9G15E Intravenous
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous drip use

Dosage and administration details:

The Clinimix N9G15E 1 L bag contained 27.5 g amino acids with electrolytes (Na, K, Ca, Mg, and PO₄) and 75 g glucose, in separate chambers, providing a total of 410 kcal/L. The final osmolarity (after mixing) was 845 mOsm/L. All 1000 mL were planned to be infused over 12 hours, resulting in a rate of infusion of approximately 83 to 84 mL/hour, not exceeding a rate of 3 mL/kg/hour.

Primary: Number of Patients with at Least One Major Local Side Effect

End point title	Number of Patients with at Least One Major Local Side Effect
-----------------	--

End point description:

Major local side effects were evaluated before the start of and at the end of an infusion. An event reported at the start of an infusion was allocated to the route of the previous administration as the "12 hour later" assessment. If an AE occurred before a change/switch of administration route, it was attributed to the previous route. The event was considered a major local side effect if, during the infusion that the major local side effect was attributed to, the subject was infused with a least 800mL of study product and the infusion was between 8 and 16 hours in duration. This endpoint was defined as the occurrence of at least 1 of the following: large edema (diameter>10cm); blistering (diameter>2cm); erythema (diameter>10cm); phlebitis; cellulitis; or strong (unbearable) pain.
