## General information about the trial

Main objective of the trial:

To establish the efficacy of 3.0 mg liraglutide compared to liraglutide placebo in inducing and maintaining weight loss over 56 weeks in obese subjects and overweight subjects with comorbidities.

Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind

Notes:

[6] - Null-hypothesis: no treatment difference between treatment arms, i.e. liraglutide 3.0 mg and liraglutide placebo. Liraglutide 3.0 mg was considered superior to placebo in inducing and maintaining weight loss as assessed by the proportion of subjects losing  $\geq 5\%$  of their fasting baseline weight, if the estimated odds ratio (liraglutide 3.0 mg/liraglutide placebo) was statistically significantly greater than one.

### Primary: Proportion of subjects losing more than 10% of baseline body weight at 56 weeks

End point title	Proportion of subjects losing more than 10% of baseline body weight at 56 weeks

End point description:

Percentage of subjects losing  $>10\%$  of baseline fasting body weight after 56-weeks of treatment (main treatment period). Analysis population: the FAS included all randomised subjects who were exposed to at least one dose of trial product (liraglutide 3.0 mg or liraglutide placebo) and who provided at least one post-baseline efficacy value. Missing data were imputed using LOCF.

### **Statistical analyses**

<b>Statistical analysis title</b>	Statistical analysis 1
-----------------------------------	------------------------

Statistical analysis description:

Weibull model was used; included treatment, sex and BMI stratification factor as fixed factors and baseline FPG as a covariate. The treatment estimate was the factor that the time to event is multiplied with for liraglutide 3.0 mg compared to placebo.

Comparison groups	Liraglutide 3.0 mg (160-Week) v Liraglutide Placebo (160-Week)
-------------------	--

Number of subjects included in analysis	2210
Analysis specification	Pre-specified
Analysis type	superiority <sup>[12]</sup>
P-value	< 0.0001
Method	Weibull analysis
Parameter estimate	Treatment estimate
Point estimate	2.681
Confidence interval	
level	95 %
sides	2-sided
lower limit	1.856
upper limit	3.872

Notes:

[12] - If the estimated time-to-event ratio (liraglutide 3.0 mg/ placebo), as assessed by the survival endpoint describing the time until onset of type 2 diabetes mellitus (T2DM) ('diabetes-free time'), is statistically significantly >1, then liraglutide 3.0 mg was to be considered superior to placebo in delaying the onset of T2DM in subjects with pre-diabetes at baseline.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

For Arm 1 and Arm 2: week 0 to week 70 (68-week of treatment period + 2-week of follow-up). For Arm 3 and Arm 4: week 0 to week 172 (160-week of treatment period + 12-week of follow-up).

Adverse event reporting additional description:

A total of 37 pre-diabetic subjects erroneously entered the re-randomised period and their adverse events (AEs) were counted under the "pre-diabetic arms". A total of 6 subjects without pre-diabetes incorrectly stratified to the 160-week treatment period and their AEs were counted under the "no pre-diabetes arms".

Change in Attachment I. Minor updates of various parts of protocol.

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

A potential limitation was the proportion of subjects who drop out during the trial, resulting in potentially biased estimates.
