Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	26 March 2019
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	07 May 2018
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to examine whether an adjuvant treatment with TKD/IL-2-activated, patient-derived NK cells following definitive RCT is feasible and effective. Comparison of progression-free survival between treatment and control group A control arm with standard radiochemotherapy (Cisplatin/Vinorelbine) is part of this study, because Pfister et al (2007) could demonstrate that lung cancer patients with an Hsp70 membrane expression had a poorer clinical outcome with respect to overall survival when compared to their Hsp70 membrane counterparts. Therefore, all historic data on overall survival of lung cancer patients are the result of a mixture of Hsp70 positive and negative patients and median overall survival of Hsp70 positive lung cancer patients is not known.

Protection of trial subjects:

The conduct of this clinical study met the local legal and regulatory requirements. The study was conducted in accordance the ethical principles of Good Clinical Practice (GCP). Participating subjects signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. The study was regularly monitored by the Sponsor and all investigators connected to the study were GCP trained.

Background therapy:

Standard of care.

Evidence for comparator: -

Actual start date of recruitment	13 January 2014
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy, Scientific research
Long term follow-up duration	18 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 16
Worldwide total number of subjects	16
EEA total number of subjects	16

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	11
From 65 to 84 years	5
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Pre-screening processes were in place for all patients. 16 patients were randomised between 27.11.2014 and 08.08.2016.

Pre-assignment

Screening details:

Patients must have all screening evaluations performed prior to the first dose of study drug and must meet all inclusion and none of the exclusion criteria. The patients must be thoroughly informed about all aspects of the study, all evaluations as required per protocol and all regulatory requirements for informed consent.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	TKD/IL-2 Activated NK_Cells

Arm description:

The group of Hsp70 positive subjects received Hsp70-peptide TKD/IL-2 activated, autologous NK cells (somatic cell therapy, plasma derived medicinal product, IMP) subsequent to standard RCT. Patients underwent leukapheresis of 3-4 hours before each treatment cycle to collect lymphocytes. A defined number of lymphocytes were activated for 3-5 days with GMP grade Hsp70-peptide TKD (Bachem) plus low dose IL-2 (100 IU/ml; Proleukin, Chiron) at a cell density of 10x10⁶ cells.

Patients were to be treated with NK therapy every 2-6 weeks on study visits (V) 2, V3, V4, and V5.

Arm type	Experimental
Investigational medicinal product name	TKD_NK
Investigational medicinal product code	
Other name	TKD/IL-2 Activated NK_Cells
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

The group of Hsp70 positive subjects received Hsp70-peptide TKD/IL-2 activated, autologous NK cells (somatic cell therapy, plasma derived medicinal product, IMP) subsequent to standard RCT. Patients underwent leukapheresis of 3-4 hours before each treatment cycle to collect lymphocytes. A defined number of lymphocytes were activated for 3-5 days with GMP grade Hsp70-peptide TKD (Bachem) plus low dose IL-2 (100 IU/ml; Proleukin, Chiron) at a cell density of 10x10⁶ cells. On day 3-5 the TKD/IL-2 activated, autologous NK cells were washed twice in Ringer's Lactate solution, re-suspended in 500 ml of Ringer's Lactate/0.1%HSA and re-infused into the patient intravenously over 30-60 min using a stem cell infusion set.

Patients were to be treated with NK therapy every 2-6 weeks on study visits (V) 2, V3, V4, and V5.

Arm title	Standard RCT

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Based of the slower than expected recruitment and current standard of care for NSCLC as recommended at this time (e.g. NCCN guidelines, 2018) the clinical trial was terminated prematurely.
--
