Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 May 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	07 October 2013
Global end of trial reached?	Yes
Global end of trial date	07 October 2013
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to evaluate the safety and tolerability of aripiprazole intramuscular (IM) Depot administered every 4 weeks for 52 weeks to participants with schizophrenia. The secondary objective was to evaluate the efficacy.

Protection of trial subjects:

In accordance with the International Conference on Harmonisation (ICH) Good Clinical Practice (GCP) Consolidated Guideline, and the applicable local laws and regulatory requirements of the countries in which the trial was conducted, copies of the protocol, amendments, and informed consent form (ICF) were reviewed and approved by the governing institutional review board (IRB) or independent ethics committee (IEC) for each investigational site or country, as appropriate, prior to trial start or prior to implementation of the amendment at that site or country.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	10 February 2009
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This open label Phase 3 study enrolled participants from the maintenance phase of study 2008-002675-27 (31-07-246) and study 2008-002676-10 (31-07-247) and new participants. Participants received aripiprazole IM depot as maintenance treatment. 1081 participants were treated in the open-label maintenance phase.

Pre-assignment

Screening details:

Screening phase (applicable if enrolled late/new participants received antipsychotic treatment other than aripiprazole), conversion phase (Phase 1, to convert from other antipsychotics to aripiprazole), oral stabilization phase (Phase 2-aripiprazole 10-30 milligram [mg]), and open-label IM phase (Phase 3-aripiprazole 400 mg IM depot).

Period 1

Period 1 title	Open-label maintenance phase (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Aripiprazole 400/300 mg IM depot
------------------	----------------------------------

Arm description:

Participants received open-label aripiprazole 400/300 mg IM depot into gluteal muscle every 4 weeks for a maximum of 52 weeks. Flexible dosing with aripiprazole 300 mg and 400 mg was permitted in order to maximize retention of participants. Participants also received supplemental oral aripiprazole (10 mg to 20 mg daily) for the first two weeks to maintain therapeutic plasma concentrations.

Arm type	Experimental
Investigational medicinal product name	Aripiprazole
Investigational medicinal product code	OPC-14597, Lu AF41155
Other name	
Pharmaceutical forms	Concentrate and solvent for solution for infusion
Routes of administration	Intramuscular use

Dosage and administration details:

Participants received open-label aripiprazole 400/300 mg IM depot into gluteal muscle every 4 weeks for a maximum of 52 weeks. Flexible dosing with aripiprazole 300 mg and 400 mg was permitted in order to maximize retention of participants. Participants also received supplemental oral aripiprazole (10 mg to 20 mg daily) for the first two weeks to maintain therapeutic plasma concentrations.

Number of subjects in period 1	Aripiprazole 400/300 mg IM depot
Started	1081
Completed	858
Not completed	223

Primary: Percentage of stable participants at Baseline who remained stable at endpoint (last visit).

End point title	Percentage of stable participants at Baseline who remained stable at endpoint (last visit). ^[1]
End point description:	
"Stable" was defined as meeting all of the following criteria: Outpatient status; Positive and negative syndrome scale (PANSS) total score ≤ 80 ; Lack of specific psychotic symptoms on the PANSS as measured by a score of ≤ 4 on each of the following items (possible scores of 1 to 7 for each item): 1) conceptual disorganization 2) suspiciousness 3) hallucinatory behaviour 4) unusual thought content; Clinical Global Impression of Severity (CGI-S) ≤ 4 (moderately ill); and Clinical Global Impression for Severity of Suicidality (CGI-SS) ≤ 2 (mildly suicidal) on Part 1 and ≤ 5 (minimally worsened) on Part 2. The percentage of stable participants at baseline who remained stable at endpoint (last visit) is described here. All participants who entered the open-label phase and had at least one post-baseline efficacy evaluation were included. N defines number of stable participants at baseline who were evaluated at the specified trial week.	
End point type	Primary
End point timeframe:	
Baseline to Week 52/Last visit	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No statistical analysis was planned for this endpoint

End point title	Percentage of participants who discontinued due to all causes.
-----------------	--

End point description:

Participants who discontinued due to any cause were noted. Limited concurrent treatment with oral

aripiprazole was permitted as rescue therapy for participants not meeting stability criteria. Rescue therapy was initiated at 10 or 15 mg daily for participants receiving aripiprazole IM depot 300 mg and at 10 mg daily for participants receiving aripiprazole IM depot 400 mg. Dose of oral aripiprazole could be increased after one week to 15 mg for efficacy needs or decreased to 5 mg for tolerability at any point during oral rescue therapy. Rescue therapy was not to be given for more than 4 weeks between 3 consecutive IM depot injections. Rescue therapy could be discontinued when the participant achieved two consecutive weeks of stability, or oral rescue dose could be decreased for an additional week at investigator's discretion, if the 4-week limit for the rescue therapy episode had not been reached. No more than 3 episodes of rescue therapy were permitted.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From the start of the open label maintenance phase until the end of treatment visit.

Adverse event reporting additional description:

A treatment emergent adverse event was defined as an adverse event (AE) that began after the start of study medication (aripiprazole IM depot/oral tablets), or an AE that continued from Baseline and became serious, related to study treatment, or resulted in death, discontinuation, interruption or reduction of study medication.

Assessment type	Non-systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 July 2008	<p>Part 1:</p> <p>A number of additions to trial procedures intended to enhance participant safety and accuracy of data were made: Replaced Brief Assessment of Cognition in Schizophrenia with Trails A, Tower of London, and Letter-Number Span cognition assessments; revised post-treatment follow-up to include phone calls 20 and 26 weeks after the last visit; added assessment of haemoglobin A1c if fasting glucose was ≥ 125 milligrams/decilitre (mg/dL) and/or the urinalysis was positive for glucose; included varenicline as a prohibited concomitant medication; added assessment of electrocardiogram (ECG) at the end of the Conversion Phase for participants who terminated prematurely from the Conversion Phase; added individual durations of pregnancy monitoring based on formulation of aripiprazole; added details for the determination of starting dose in the Oral Stabilization Phase based on the participant's prior history with the double-blind trials and oral aripiprazole; added descriptions for determination of body mass index and waist circumference; added requirement for withdrawal of participants who continued to meet exacerbation of psychotic symptoms/impending relapse criteria after receiving 3 episodes of oral aripiprazole tablet rescue therapy. Participants not meeting stability criteria, but not in impending relapse could continue in the trial at the investigator's discretion; added requirement that participants meeting exacerbation of psychotic symptoms/impending relapse criteria must receive oral aripiprazole tablet rescue therapy.</p>
29 July 2008	<p>Part 2:</p> <p>Revised exclusion criterion related to abstinence/contraceptive use based on half-life of aripiprazole; clarified that participants who receiving aripiprazole in combination with any other antipsychotic(s) must enter the Conversion Phase in order to discontinue other antipsychotic(s). Only participants who received aripiprazole as monotherapy after the last visit of Trials 246/247 or at screening of Trial 31-08-248 (if applicable) could progress directly to the Oral Stabilization Phase; revised key secondary efficacy endpoints based on feedback from the Food and Drug Administration and adjusted statistical methods accordingly; clarified rules for rescue therapy; replaced Columbia Suicide Severity Rating Scale(C-SSRS) in protocol appendix; specified that a modified version of the CSSRS-European Version would be used for this trial to reduce redundant data capture and replace the sample form in the appendix with the modified form; removed table of trial day intervals for determination of visit dates; clarified that the last visit of the Open-label IM Depot Maintenance Phase was required to occur 379 days (1 year plus 2 weeks) after the first dose of open-label aripiprazole IM depot; clarified that Investigator Assessment and Patient Satisfaction with Medication Questionnaire -Modified should be completed only for participants who participated in the Conversion Phase of Trial 248 or de novo participants who had not been enrolled in Trials 246/247 so that treatment with aripiprazole IM depot could be compared with other antipsychotic(s) taken prior to entry into Trial 31-08-248; clarified that participants receiving more than one benzodiazepine at screening could qualify for the trial if they discontinued one of the benzodiazepines during the screening period; clarified that investigator- and subject-rated assessments of injection site were to be based on the site of the most recent injection; ECGs would be obtained "approximately" 5 minutes apart.</p>

18 November 2009	<p>Part 1:</p> <p>Updated general information on aripiprazole in introductory sections based on most recent Investigator Brochure and completed clinical study reports; revised trial design description to clarify antipsychotic medication requirements at screening (including definition of "lapse" in aripiprazole or antipsychotic medication at time of trial entry), as these requirements related to participant entry into the Conversion Phase vs directly into the Oral Stabilization Phase of the trial; clarified language regarding "non-generic oral aripiprazole monotherapy (trial drug)."; added a table delineating recommendation for switching from other generic oral aripiprazole to non-generic oral aripiprazole monotherapy; changed nomenclature of "additional" participants to "new" participants (participants who had not been enrolled in either Trial 31-07-246 or Trial 31-07-247 who enroll in Trial 31-08-248 as their first aripiprazole IM depot trial); Clarified Personal and Social Performance Scale as "other" assessments rather than "efficacy" assessments; added that a pharmacokinetic blood sample was to be collected in the event of a serious adverse event in the Open-label IM Depot Maintenance Phase (aripiprazole IM depot phase only); clarified that the aripiprazole IM depot injection site would be evaluated before and after each injection. Immediately prior to the first aripiprazole IM depot injection site, the anticipated injection site was to be evaluated; added assessment of C-SSRS at all postbaseline visits, rather than as determined by CGI-SS score, and renaming the "postbaseline C-SSRS" as "C-SSRS since last visit."; refined exclusion criteria regarding screening ECG values for QTc interval; Clarified information that should be included in source documentation; clarified that prolactin levels would be assessed at Week 6/end of the Conversion Phase/ET; clarified that participants who discontinued any phase of the trial were not eligible to be rescreened to enter the trial</p>
18 November 2009	<p>Part 2:</p> <p>Included explanation that the Letter-Number Span assessment of cognition was not able to be completed in countries with Cyrillic and character-based languages; included a requirement for the physical examination to include the genitourinary body system with the option that the assessment could be performed within 1 year prior to the end of the screening period provided that documentation of the examination and records of results were provided to the trial investigator. A genitourinary examination was required annually (every 52 weeks) during the trial; clarified allowances/restrictions regarding concomitant medications (zolpidem extended-release, propranolol); added instruction to investigators regarding subject false-positive drug screen results during the trial; revised statistical analysis methods; replaced PANSS and C-SSRS in protocol appendix with most current versions; revised Resource Utilization Questionnaire; added Subject Experience with IM Depot Medication survey; clarified initiation of rescue therapy strategy; updated trial design to include the long-term extension trial; clarified the stability assessment to be done at Weeks 3, 6, and 10; increased the number of participants from 500 to 500-800. In addition, a number of administrative clarifications were made, including changes to text to enhance readability and correct typographical errors.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
