Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	21 June 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	09 May 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To compare the efficacy of lenalidomide versus chlorambucil as first-line therapy in elderly patients.

Protection of trial subjects:

Patient Confidentiality, Personal Data Protection, Archiving of Essential Documents

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	11 November 2009
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	5 Years
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 2
Country: Number of subjects enrolled	Australia: 19
Country: Number of subjects enrolled	Belgium: 7
Country: Number of subjects enrolled	Brazil: 38
Country: Number of subjects enrolled	Bulgaria: 19
Country: Number of subjects enrolled	Canada: 21
Country: Number of subjects enrolled	Chile: 3
Country: Number of subjects enrolled	Colombia: 4
Country: Number of subjects enrolled	Croatia: 12
Country: Number of subjects enrolled	Czech Republic: 2
Country: Number of subjects enrolled	Denmark: 4
Country: Number of subjects enrolled	Hungary: 40
Country: Number of subjects enrolled	Israel: 18
Country: Number of subjects enrolled	Italy: 46
Country: Number of subjects enrolled	Netherlands: 5
Country: Number of subjects enrolled	New Zealand: 5

Country: Number of subjects enrolled	Portugal: 7
Country: Number of subjects enrolled	Romania: 10
Country: Number of subjects enrolled	Russian Federation: 45

Country: Number of subjects enrolled	South Africa: 12
Country: Number of subjects enrolled	Slovakia: 2
Country: Number of subjects enrolled	Spain: 16
Country: Number of subjects enrolled	Serbia: 10
Country: Number of subjects enrolled	United Kingdom: 10
Country: Number of subjects enrolled	United States: 63
Worldwide total number of subjects	450
EEA total number of subjects	212

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	435
85 years and over	15

Subject disposition

Recruitment

Recruitment details:

118 sites randomized participants in Austria, Australia, Belgium, Brazil, Bulgaria, Canada, Chile, Columbia, Croatia, Czech Republic, Denmark, Hungary, Israel, Italy, the Netherlands, New Zealand, Poland, Portugal, Romania, Russia, South Africa, Slovakia, Spain, Serbia, the United Kingdom, and the United States of America

Pre-assignment

Screening details:

Participants were randomized 1:1 to lenalidomide or chlorambucil and stratified by disease stage, presence of pre-defined co-morbidities and presence of at least one of the following poor prognostic factors: 11q deletion, 17 p deletion, unmutated IgVH and B2M>4.0 mg/dL.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Lenalidomide

Arm description:

For participants with normal renal function [defined as Creatinine Clearance (CrCL) ≥ 60 mL/min], 5 mg lenalidomide was administered by mouth (PO) once daily (QD) on Days 1 through 28 of the first 28-day cycle, 10 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 15 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until progressive disease (PD) or unacceptable toxicity, whichever occurred first. For participants with moderate renal impairment (defined as CrCL ≥ 30 to < 60 mL/min), 2.5 mg lenalidomide PO QD on Days 1 through 28 of the first 28-day cycle, 5 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 7.5 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until PD or unacceptable toxicity, whichever occurred first.

Arm type	Experimental
Investigational medicinal product name	CC-5013
Investigational medicinal product code	
Other name	Revlimid
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

5 mg lenalidomide PO QD for participants with normal renal function [defined as CrCL ≥ 60 mL/min], on Days 1 through 28 of the first 28-day cycle, 10 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 15 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until PD or unacceptable toxicity, whichever occurred first. For participants with moderate renal impairment (defined as CrCL ≥ 30 to < 60 mL/min), 2.5 mg lenalidomide PO QD on Days 1 through 28 of the first 28-day cycle, 5 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 7.5 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until PD or unacceptable toxicity, whichever occurred first.

Arm title	Chlorambucil
------------------	--------------

Arm description:

Chlorambucil oral tablets at 0.8 mg/kg on Days 1 and 15 of each 28-day cycle for a total duration of 12 months (approximately 13 cycles).

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Chlorambucil
Investigational medicinal product code	
Other name	Leukeran
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Chlorambucil tablets at 0.8 mg/kg on Days 1 and 15 of each 28-day cycle

Number of subjects in period 1	Lenalidomide	Chlorambucil
Started	225	225
Safety Population	224	223
Completed	0	1
Not completed	225	224
Adverse event, serious fatal	9	3
Consent withdrawn by subject	7	5
Completed 13 cycles of treatment	-	118
Adverse event, non-fatal	63	35
PD without histologic change	27	23
Unspecified	114	32
Lost to follow-up	2	2
Untreated before cycle 1	1	2
PD with histologic change	-	2
Protocol deviation	2	2

Baseline characteristics

Primary: Kaplan-Meier Estimate of Progression Free Survival (PFS)

End point title	Kaplan-Meier Estimate of Progression Free Survival (PFS)
End point description:	
Progression-free survival = the time from randomization to the first documented progression confirmed per investigator's assessment or death due to any cause, whichever occurred first. Progressive disease included lymphadenopathy, an appearance of any new lesion such as enlarged lymph nodes ($>$ 1.5 cm), splenomegaly, hepatomegaly or other organ infiltrates, an increase by 50% or more in greatest determined diameter of any previous site or an increase by 50% or more in the sum of the product of diameters of multiple nodes. The progression date was assigned to the earliest time when any progression was observed without prior missing assessments. If withdrawal of consent or lost to follow-up occurred before progression or death, then these observations were censored at the date when the last complete tumor assessments determined a lack of progression. The ITT population = all subjects who were randomized, independent of whether they received study treatment or not.	
End point type	Primary
End point timeframe:	
Data cut-off of 18 Feb 2013; up to approximately 39 months	

End point values	Lenalidomide	Chlorambucil

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All AEs were recorded by the Investigator(s) from first dose of study drug to 30 days after the treatment discontinuation visit. The median treatment duration was 263 days for lenalidomide and 362 days for chlorambucil.

Adverse event reporting additional description:

Secondary Primary Malignancies (SPMs) were monitored and are reported as SAEs regardless of the arm the participant was in. These are reported from the time of signing the informed consent up to and including the survival follow-up period. Participants were followed for at least 5 years from the date the last patient was randomized.

Assessment type	Systematic

Reporting groups

Reporting group title	Chlorambucil
-----------------------	--------------

Reporting group description:

Chlorambucil oral tablets at 0.8 mg/kg on Days 1 and 15 of each 28-day cycle for a total duration of 12 months

Reporting group title	Lenalidomide
-----------------------	--------------

Reporting group description:

For participants with normal renal function [defined as Creatinine Clearance (CrCL) ≥ 60 mL/min], 5 mg lenalidomide was administered by mouth (PO) once daily (QD) on Days 1 through 28 of the first 28-day cycle, 10 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 15 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until progressive disease (PD) or unacceptable toxicity, whichever occurred first. For participants with moderate renal impairment (defined as CrCL ≥ 30 to < 60 mL/min), 2.5 mg lenalidomide PO QD on Days 1 through 28 of the first 28-day cycle, 5 mg lenalidomide PO QD on Days 1 through 28 starting at cycle 2, 7.5 mg lenalidomide PO QD starting at cycle 3 and for the remainder of the study until PD or unacceptable toxicity, whichever occurred first.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 March 2009	<ol style="list-style-type: none">1. Modified language about anti-thrombotic therapy to be consistent with other CLL protocols.2. Deleted inclusion criterion (must not have received a prior treatment for B-cell CLL) as this was listed as an exclusion criterion (Prior treatment for B-cell CLL).3. Deleted exclusion criterion (uncontrolled hyperthyroidism or hypothyroidism)4. Added the exclusion criterion (serum total bilirubin > 1.5 x ULN, except in case of hemolytic anemia or Gilbert's syndrome) and deleted co-morbidity of bilirubin ≥ 2.0 times ULN, with the exception of Gilbert's syndrome.5. Added nPR as a response and changed the CR/CRi confirmation visit to ≥ 8 weeks after all clinical and laboratory response criteria had been met to be consistent with December 2008 Hallek criteria.6. Changed the time for retesting peripheral blood and bone marrow for MRD status from 16 weeks to 8 weeks for subjects who reached CR/CRi with blood negativity achieved within the 6 months after the CR/CRi confirmation visit and the bone marrow was still MRD positive.7. Added that if bone marrow was hypocellular at the CR/CRi confirmation visit, a repeat specimen (including adequate biopsy sample) was to be obtained 4 weeks later provided that blood counts had recovered.8. Clarified that allopurinol therapy was to be started only after confirmation of the subject's eligibility in the study.9. Removed ibuprofen as a suggested treatment for \geq Grade 2 tumor flare because of the potential impact of ibuprofen on renal function.10. Added a pregnancy test assessment at Study Day 1 for subjects in the chlorambucil arm.11. Changed the Broca's index to formula referenced in the Robinson, 1983 article.12. Added dose reduction and modification guidelines for changes in liver function.13. Clarified that thyroid function tests were required for all subjects at screening and for subjects in the lenalidomide arm at additional specified intervals during the study.
23 October 2009	<ol style="list-style-type: none">1. Corrected the disease stage stratification to include Binet Stage B with the Rai Stage I and II category instead of the Rai Stage III and IV category.2. Allowed the splitting of the chlorambucil dose over 2 days for subjects who could not swallow a full dose in 1 day and allowed the use of systemic anti-emetics prior to chlorambucil treatment.3. Clarified that the MRD analysis was to be repeated each time a CR/CRi confirmation was performed. For this analysis, an additional peripheral blood sample was to be collected.4. Limited allopurinol use for TLS prophylaxis to allopurinol 300 mg/day for 3 days prior to starting study treatment and for the first cycle of treatment for subjects in the chlorambucil arm, and added guidance that all subjects entering the study on allopurinol for an indication other than TLS were to continue on their prescribed dose according to the stipulated guidance.5. Modified the required prophylaxis regimen for thromboembolic events; additional guidance was added to allow investigators to choose the most appropriate anti-thrombotic therapy based on subject's thrombotic and bleeding risks.6. Allowed the investigators more flexibility for the treatment of \geq Grade 1 TLS.7. Add an exclusion criterion for subjects with a known allergy to allopurinol.

15 January 2010	<ol style="list-style-type: none"> 1. Added guidance to investigators to interrupt, adjust, or discontinue anti-thrombotic treatment for subjects with platelet counts < 50,000/μL and for subjects with platelet count < 20,000/μL. 2. Added guidance to investigators that Study Day 1 laboratory values were to be carefully reviewed within the first few days of study therapy initiation and appropriate dose reductions/interruptions made based on these results and that clinical assessments (physical examination and vital signs) were to be carefully assessed on Study Day 1 prior to subjects entering the study. 3. Corrected the formula used to determine Broca's ideal weight for women.
11 April 2011	<ol style="list-style-type: none"> 1. Deleted the exclusion criterion for subjects with uncontrolled hyperthyroidism or hypothyroidism. 2. Changed the visit schedule to reduce the number of visits in Cycle 1 and Cycle 2 and the first and second cycle of each dose escalation. 3. Defined the end of study as the time when all subjects had been followed for at least 5 years following randomization and when at least 284 deaths had occurred. 4. Allowed the use of historic/archived bone marrow core or 10-cut, unstained biopsy slides that had been collected within 60 days of screening for the purposes of the screening histology review. 5. Allowed the use of peripheral blood for FISH, ZAP-70, IgVH mutational status analyses and storage obtained within 84 days of Study Day 1 as the screening sample for subjects who were re-screened. 6. Required that all subjects who discontinued treatment or the progression-free follow up phase for reasons other than PD be followed until PD and/or death. 7. Added quality of life assessments during the Survival Follow-Up Phase. 8. Required that subjects with decreased renal function ($\text{CrCL} \geq 30$ to < 60 mL/min) take a reduced dose of 100 mg of allopurinol. 9. Modified the allopurinol treatment schedule for subjects on lenalidomide to the first cycle of treatment and the first cycle of each dose escalation. 10. Allowed subjects with carcinoma in situ of the bladder to enroll in the study. 11. Corrected the timing of the first ECG from Cycle 4, Day 1 to Cycle 5, Day 1. 12. Deleted the requirement for a bone marrow aspirate and biopsy to be collected for molecular CR determination. 13. Required SMPs to be treated as SAEs and reported throughout study.
10 November 2011	<ol style="list-style-type: none"> 1. Changed the exclusion criteria for subjects with a history of prior malignancies from 3 years to ≥ 5 years. 2. Added exploratory analyses of biomarkers of study drug activity (DNA, RNA, protein). 3. Clarified that the thyroid function tests for subjects on lenalidomide, and the ECG and Quality-of-Life questionnaires for subjects in both arms were not required during drug holds. 4. Required all Grade 3 hematologic laboratory abnormalities to be reported as AEs on the AE page of the eCRF.
06 May 2013	<ol style="list-style-type: none"> 1. Required the immediate discontinuation of study drug, regardless of treatment assignment, for all subjects 81 years of age or older at the time of signing the informed consent, and provided guidance for subsequent follow-up for these subjects and for subjects 70 to 80 years of age at the time of signing the informed consent who continued in the study.
02 August 2013	<ol style="list-style-type: none"> 1. Required the immediate discontinuation of lenalidomide treatment for all subjects randomized to the lenalidomide arm and provided guidance for subsequent follow-up for these subjects. 2. Allowed subjects in the chlorambucil arm to continue to receive study drug at the discretion of the investigator for a total duration of 13 cycles (approximately 12 months) or until PD or unacceptable toxicity developed, whichever occurred first. 3. Deleted all efficacy assessments. 4. Deleted the 28-day progression-free follow-up period and required that all subjects enter the survival follow-up period and were contacted every 4 months to collect information on SPMs, OS, and other anti cancer CLL therapies for at least 5 years after the last subject was randomized.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
12 July 2012	The FDA placed the study on partial clinical hold due to the greater number of deaths reported in the lenalidomide arm compared with the chlorambucil arm, and a trend in overall survival in favor of chlorambucil.	02 August 2013

Notes:

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

After notification by the US Food and Drug Administration on 12Jul2013, Celgene agreed to stop lenalidomide due to an imbalance in the number of deaths on the lenalidomide arm versus the chlorambucil arm; no causality for the imbalance was identified
--

Notes:
