Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 December 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	08 May 2015
Global end of trial reached?	Yes
Global end of trial date	31 December 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study is to determine the effect of selenium, in addition to standard care, on the recurrence of bladder cancer.

Protection of trial subjects:

Adverse events and adverse reactions will be monitored during each follow-up visit and will be noted on the case report forms. The obligation starts from the moment the informed consent is signed until 30 days after the administration of the last dose. The principal Investigator will decide whether the serious adverse event is related or unrelated to the trial treatment. It is anticipated that the risk and side effects of the additional supplement of 200µg selenium will be minor. Nevertheless, harm-related data will be collected and reported according the recommendation made by the CONSORT statement.

Background therapy:

In Belgium, bladder cancer (BC) is the fifth most common cancer in men. The per-patient lifetime cost is high. Previous epidemiological studies have consistently reported that selenium concentrations were inversely associated with the risk of BC. We therefore hypothesised that selenium may be suitable for chemoprevention of recurrence of BC.

Evidence for comparator: -

Actual start date of recruitment	18 September 2009
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 292
Worldwide total number of subjects	292
EEA total number of subjects	292

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	65
From 65 to 84 years	195
85 years and over	32

Subject disposition

Recruitment

Recruitment details:

Eligible patients were recruited through the urology department of 14 Belgian hospitals. Eligible patients provided their written informed consent. Patients were randomly assigned by a computer program to oral selenium yeast 200 µg once a day or placebo for three years, in addition to standard care.

Pre-assignment

Screening details:

All randomised patients were included in the intention to treat and safety analyses. Per protocol analyses included all patients in the study three months after start date. Between September 18, 2009 and April 18, 2013, 151 and 141 patients were randomised in the selenium and placebo group. Patients were followed until December 31, 2015.

Pre-assignment period milestones

Number of subjects started	694 ^[1]
Intermediate milestone: Number of subjects	Assessed for eligibility: 694
Intermediate milestone: Number of subjects	Randomised: 292
Number of subjects completed	292

Pre-assignment subject non-completion reasons

Reason: Number of subjects	not meeting inclusion criteria: 243
Reason: Number of subjects	No malignity: 57
Reason: Number of subjects	Not available: 50
Reason: Number of subjects	Declined to participate: 39
Reason: Number of subjects	cystectomy: 8
Reason: Number of subjects	Adverse event, serious fatal: 5

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 694 pts were assessed for eligibility. Out of this number, 402 pts were excluded, leaving 292 pts that could be randomised. In the Intention to treat analysis (292 pts in total) 151 pts were allocated to the Selenium 200mcg group and 141 pts were allocated to placebo.

Period 1

Period 1 title	Baseline
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer

Arms

Are arms mutually exclusive?	Yes
Arm title	Selenium
Arm description: -

Subject analysis sets

Subject analysis set title	ITT
Subject analysis set type	Intention-to-treat

Subject analysis set description:

The ITT analysis showed recurrence in 43 (28%; 95% CI, 0.21e0.35) and 45 (32%; 95% CI, 0.24e0.40) patients in the selenium and placebo group. HR (hazard ratio) was 0.85 (95% CI, 0.56e1.29). The log-rank test was not significant (p Z 0.44). Adjustment for age, gender, smoking status, staging, baseline serum selenium level and hospital did not alter the results. There was no interaction between treatment and gender, age or smoking status. Excluding those patients who discontinued the intervention did not alter HR of ITT analysis (p Z 0.39).

Subject analysis set title	PPA
Subject analysis set type	Per protocol

Subject analysis set description:

PPA, performed for all patients still participating at T3, showed an overall recurrence for 42 and 39 (28%; 95% CI, 0.20e0.35) patients in the selenium and placebo group (HR Z 0.96 [95% CI, 0.62e1.48]). The log-rank test was not significant (p Z 0.85) (Fig. 2). Excluding those patients who discontinued the intervention resulted in an HR of 0.94 (95% CI, 0.61e1.45). The log-rank test was not significant (p Z 0.78).

Statistical analyses

Statistical analysis title	Difference in percent of BC recurrence after 3Y
Statistical analysis description:	
All randomised patients were included in the intention to treat (ITT) and safety analyses. KaplanMeier estimates of a recurrence-free interval were used to compare treatment groups descriptively, while log-rank tests were used to test the hypothesis of no difference between treatments. Cox proportional hazards regression models were used to estimate the hazard ratio (HR) and 95% confidence intervals (CI) comparing patients randomised to selenium or placebo. T0 was when ICF was signed.	
Comparison groups	ITT v PPA
Number of subjects included in analysis	292
Analysis specification	Pre-specified
Analysis type	equivalence ^[1]
P-value	= 0.05 ^[2]
Method	Logrank
Parameter estimate	Cox proportional hazard
Point estimate	0.85
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.56
upper limit	1.29
Variability estimate	Standard deviation
Dispersion value	21.5

Notes:

[1] - The end date for each pt was the day of recurrence, cystectomy or death, or the day the pt withdrew from the trial, or 3 Y after T0, or the end date of the trial (31Dec15). PPA included all patients in the study 3 months after the starting date (T3). Pts who withdrew as well as pts with cystectomy within the first 3 months were excluded from PPA. Two sensitivity analyses were performed excluding all pts that ended the trial prematurely, the first based on ITT analysis, the second based on PPA.

[2] - KM estimates of a recurrence-free interval to compare trtmnt groups descriptively, log-rank tests to test the hypothesis of no difference between trtmnts. Cox proportional hazards regression models to estimate HR and 95%CI comparing pts rand to Se/Pl

Secondary: Secondary outcome: progression

End point title	Secondary outcome: progression
End point description:	
Twenty-nine patients showed progression of whom 15 occurred in the selenium group and 14 in the placebo group. Performing the ITT analysis resulted in an HR of 0.97 (95% CI, 0.47e2.00; p Z 0.93). Patients taking selenium had 48% more chance of progression than those in the placebo group, although not statistically significant (HR Z 1.48 [95% CI, 0.65e3.38]; p Z 0.35). Excluding those patients from the analysis who discontinued their treatment resulted in a similar HR.	
End point type	Secondary
End point timeframe:	
After three months (T3), progression was seen in 24 patients. The mean progression time was 22 months for both groups.	

End point values	ITT			
Subject group type	Subject analysis set			
Number of subjects analysed	292			
Units: patients				
number (confidence interval 95%)				
Progression	0.97 (0.47 to 2.00)

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events and adverse reactions were monitored during each follow-up visit and were noted on the case report forms. The obligation started from the moment the informed consent was signed until 30 days after the administration of the last dose.

Adverse event reporting additional description:

The principal Investigator will decide whether the serious adverse event is related or unrelated to the trial treatment. The decision will be recorded on the serious adverse event form. The principal Investigator will sign the form.

Assessment type	Non-systematic
