

## Clinical trial results:

**A randomized, double-blind, placebo controlled, withdrawal study of flare prevention of canakinumab (ACZ885) in patients with Systemic Juvenile Idiopathic Arthritis (SJIA) and active systemic manifestations**

**Due to EudraCT system limitations, which EMA is aware of, data using 999 as data points in this record are not an accurate representation of the clinical trial results. Please use <https://www.novctrd.com/CtrdWeb/home.novfor> complete trial results.**

## Summary

EudraCT number	2008-005479-82
Trial protocol	ES NO FR HU BE DE SE IT GB DK AT GR Outside EU/EEA
Global end of trial date	12 September 2011

## Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000060-PIP02-08
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes
--	-----

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	12 September 2011
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	12 September 2011
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

This was a two-part study, the main objective of Part I was to assess the efficacy of canakinumab, in terms if it allowed tapering of maintenance dose of oral steroids in at least 25% of the study subjects and the main objective of Part II was to demonstrate that the time to flare was higher with canakinumab than with placebo.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	06 July 2009
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 8
Country: Number of subjects enrolled	Norway: 3
Country: Number of subjects enrolled	Poland: 4
Country: Number of subjects enrolled	Spain: 10
Country: Number of subjects enrolled	Sweden: 3
Country: Number of subjects enrolled	United Kingdom: 14
Country: Number of subjects enrolled	Austria: 1
Country: Number of subjects enrolled	Belgium: 10
Country: Number of subjects enrolled	France: 23
Country: Number of subjects enrolled	Germany: 17
Country: Number of subjects enrolled	Greece: 1

Country: Number of subjects enrolled	Argentina: 2
Country: Number of subjects enrolled	Switzerland: 4
Country: Number of subjects enrolled	Israel: 14
Country: Number of subjects enrolled	Peru: 3
Worldwide total number of subjects	177
EEA total number of subjects	114

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	1
Children (2-11 years)	128
Adolescents (12-17 years)	42
Adults (18-64 years)	6
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at 63 centres in 21 countries.

### Pre-assignment

Screening details:

A total of 177 subjects were enrolled into Part I open-label period and 100 subjects were enrolled into Part II double-blind withdrawal period.

### Period 1

Period 1 title	Part I
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

As the Part I was an open-label period, this section was not applicable.

### Arms

Arm title	ACZ885 (Part I)
-----------	-----------------

Arm description:

Subjects received single dose of 4 milligram/kilogram (mg/kg) canakinumab subcutaneous (s.c.) injection every 4 weeks up to maximum of 32 weeks. Part 1 was divided into 4 sub-parts: Part Ia (4 weeks) and Part Ib (4 weeks), subjects were maintained on a stable oral steroid dose (prednisone or equivalent) followed by Part Ic (20 weeks), during which subjects received tapered doses of steroid. In Part Id (4 weeks), subjects again received stable steroid dose.

Arm type	Experimental
Investigational medicinal product name	Canakinumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Single dose of 4 mg/kg canakinumab s.c. injection every 4 weeks up to maximum of 32 weeks.

Number of subjects in period 1	ACZ885 (Part I)
Started	177
Completed	100
Not completed	77
Adverse event, non-fatal	4
Death	1
Unsatisfactory therapeutic effect	72

## Period 2

Period 2 title	Part II
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

### Blinding implementation details:

The identity of the canakinumab/placebo treatments were concealed by the use of study drugs in the form of syringes filled with reconstituted canakinumab solutions that were identical in appearance. Unblinding was allowed only in the case of subject emergencies, for Data Monitoring Committee (DMC) interim safety review and when the study was completed.

## Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	ACZ885 (Part II)

### Arm description:

Subjects received 4 mg/kg canakinumab s.c. injection every 4 weeks and remained on stable oral steroid dose for 24 weeks. The maximal total single dose of canakinumab allowed was 300 mg. Any subject who required a dose greater than 150 mg (body weight more than 37.5 kg), received two s.c. injections of canakinumab. Subjects with oral prednisolone dose between 0.2 mg/kg and 0.5 mg/kg and no flare for at least 24 weeks, were allowed to receive tapered doses of prednisolone. If the dose of oral prednisolone was less than or equal to ( $\leq$ ) 0.2 mg/kg, subjects continued to maintain their current dose for the remainder of Part II.

Arm type	Active comparator
Investigational medicinal product name	Canakinumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

### Dosage and administration details:

Subjects received single dose of 4 mg/kg canakinumab s.c. injection every 4 weeks up to maximum of 75 weeks.

<b>Arm title</b>	Placebo (Part II)
------------------	-------------------

### Arm description:

Subjects in Part II were received placebo matching to canakinumab s.c. injection every 4 weeks up to maximum of 75 weeks. Subjects with oral prednisolone dose between 0.2 mg/kg and 0.5 mg/kg and no flare for at least 24 weeks, were allowed to receive tapered doses of prednisolone. If the dose of oral prednisolone was  $\leq$  0.2 mg/kg, subjects continued to maintain their current dose for the remainder of Part II.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for solution for injection
Routes of administration	Subcutaneous use

### Dosage and administration details:

Single dose of placebo matching to canakinumab s.c injection every 4 weeks up to maximum of 75 weeks.

<b>Number of subjects in period 2</b>	ACZ885 (Part II)	Placebo (Part II)
Started	50	50
Completed	39	24
Not completed	11	26
Consent withdrawn by subject	-	1
Adverse event, non-fatal	-	4
Unsatisfactory therapeutic effect	11	20
Protocol deviation	-	1

## Baseline characteristics

### Reporting groups

Reporting group title	ACZ885 (Part I)
-----------------------	-----------------

Reporting group description:

Subjects received single dose of 4 milligram/kilogram (mg/kg) canakinumab subcutaneous (s.c.) injection every 4 weeks up to maximum of 32 weeks. Part 1 was divided into 4 sub-parts: Part Ia (4 weeks) and Part Ib (4 weeks), subjects were maintained on a stable oral steroid dose (prednisone or equivalent) followed by Part Ic (20 weeks), during which subjects received tapered doses of steroid. In Part Id (4 weeks), subjects again received stable steroid dose.

Reporting group values	ACZ885 (Part I)	Total	
Number of subjects	177	177

## End points

### End points reporting groups

Reporting group title	ACZ885 (Part I)
Reporting group description: Subjects received single dose of 4 milligram/kilogram (mg/kg) canakinumab subcutaneous (s.c.) injection every 4 weeks up to maximum of 32 weeks. Part 1 was divided into 4 sub-parts: Part Ia (4 weeks) and Part Ib (4 weeks), subjects were maintained on a stable oral steroid dose (prednisone or equivalent) followed by Part Ic (20 weeks), during which subjects received tapered doses of steroid. In Part Id (4 weeks), subjects again received stable steroid dose.	
Reporting group title	ACZ885 (Part II)
Reporting group description: Subjects received 4 mg/kg canakinumab s.c. injection every 4 weeks and remained on stable oral steroid dose for 24 weeks. The maximal total single dose of canakinumab allowed was 300 mg. Any subject who required a dose greater than 150 mg (body weight more than 37.5 kg), received two s.c. injections of canakinumab. Subjects with oral prednisolone dose between 0.2 mg/kg and 0.5 mg/kg and no flare for at least 24 weeks, were allowed to receive tapered doses of prednisolone. If the dose of oral prednisolone was less than or equal to ( $\leq$ ) 0.2 mg/kg, subjects continued to maintain their current dose for the remainder of Part II.	
Reporting group title	Placebo (Part II)
Reporting group description: Subjects in Part II were received placebo matching to canakinumab s.c. injection every 4 weeks up to maximum of 75 weeks. Subjects with oral prednisolone dose between 0.2 mg/kg and 0.5 mg/kg and no flare for at least 24 weeks, were allowed to receive tapered doses of prednisolone. If the dose of oral prednisolone was $\leq$ 0.2 mg/kg, subjects continued to maintain their current dose for the remainder of Part II.	

### Primary: Percentage of subjects able to taper oral steroid use from the start of Part I to end of Part Ic

End point title	Percentage of subjects able to taper oral steroid use from the start of Part I to end of Part Ic <sup>[1]</sup>
End point description: The ability to taper oral steroids was defined as if dose was reduced from start of Part I to end of Part Ic from $>0.8$ mg/kg/day to $\leq 0.5$ mg/kg/day, or from $\geq 0.5$ mg/kg/day and $\leq 0.8$ mg/kg/day by at least 0.3 mg/kg, or from any initial dose to $\leq 0.2$ mg/kg/day, while maintaining a minimum adapted ACR 30 paediatric criterion (defined as improvement from baseline of $\geq 30\%$ in at least 3 of the first 6 response variables of adapted ACR paediatric criteria; no intermittent fever in the preceding week and no more than one of the first 6 response variables worsening by more than 30%). Subjects on oral steroids at study entry who did not enter Part 1c were considered steroid tapering failures. The analysis was performed in full analysis set (FAS) population, defined as all subjects who received at least one dose of study drug in Part I.	
End point type	Primary
End point timeframe: Day 1 up to Week 28	

#### Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Only descriptive summary statistics was planned for this outcome measure.

## Statistical analyses

No statistical analyses for this end point

### Primary: Time to disease flare in Part II

End point title	Time to disease flare in Part II
-----------------	----------------------------------

End point description:

Disease flare was defined if at least one of following criteria was met: 1.Reappearance of fever(>38°C,lasting for at least 2 consecutive days) not due to infections, 2.Flare according to adapted ACR paediatric criteria such as  $\geq 30\%$  worsening in at least 3 of first 6 response variables and  $\geq 30\%$  improvement in not more than 1 of first 6 response variables. The worsening of response variables was further defined as worsening of  $\geq 20$  millimetres(mm) in physician or parent global assessment, worsening in mobility of at least 2 joints and serum C-reactive protein(CRP) level to be more than 30 milligrams/litres(mg/L). Kaplan Meier estimate was used to analyze probability to experience a flare in subject. Flare Analysis was done in FAS II population, defined as all subjects who received at least one dose of study drug in Part II. Here, 99999.9 represents not estimable data because EudraCT system is not accepting "NA" for not available/not estimable data.

End point type	Primary

## Secondary: Change in disability from Week 32 assessed with the Child Health Assessment Questionnaire-Disability Index (CHAQ-DI) to end of Part II

End point title	Change in disability from Week 32 assessed with the Child Health Assessment Questionnaire-Disability Index (CHAQ-DI) to end of Part II
-----------------	--

End point description:

The CHAQ was used to assess physical ability and functional status of subjects as well as quality of life. The disability dimension consists of 20 multiple choice items concerning difficulty in performing eight common activities of daily living; dressing and grooming, arising, eating, walking, reaching, personal hygiene, gripping and other "activities". Parents were chosen from four response categories, ranging from 0 (without any difficulty) to 3(unable to do). Change from baseline was calculated by using the formula = (post-baseline value – baseline value). A negative change indicates improvement. The analysis was performed in FAS II population.

End point type	Secondary
----------------	-----------

End point timeframe:

Week 32 (start of Part II), Week 88 (end of Part II)

End point values	ACZ885 (Part II)	Placebo (Part II)		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	50	50		
Units: Units on a scale				
least squares mean (standard error)	0.1184 (± 0.17592)	0.1258 (± 0.18241)		

## Statistical analyses

No statistical analyses for this end point

## Secondary: Change from baseline in Health Related Quality of Life (HRQoL) assessed by Child Health Questionnaire Parent Form (CHQ-PF50) to end of Part II

End point title	Change from baseline in Health Related Quality of Life (HRQoL)
-----------------	--

End point description:

The Child Health Questionnaire – Parent Form (CHQ-PF50) instrument was used to measure HRQoL aged 5 to 18 years from a parent's perspective. This 14-concept questionnaire measured physical and psychosocial health of the subjects on following points: physical functioning, role/social emotional, role/social behavior, role/social physical, bodily pain, general behavior, mental health, self-esteem, general health perception, change in health, parental impact – emotional, parental impact – time, family activities, and family cohesion. Total score ranged from 0-100. Increase in score represented improvement in overall well-being of subjects. Change from baseline was calculated by using the formula = (post-baseline value – baseline value). The analysis was performed in FAS II population.

End point type	Secondary
----------------	-----------

End point timeframe:

Week 32 (start of Part II), Week 88 (end of Part II)

End point values	ACZ885 (Part II)	Placebo (Part II)		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	39	37		
Units: Units on a scale				
least squares mean (standard error)				
CHQ-PF50 physical health score	3.9 (± 2.54)	0.3 (± 2.53)		
CHQ-PF50 psychosocial health score	2.5 (± 1.88)	0.5 (± 1.86)		

## Statistical analyses

No statistical analyses for this end point

## Secondary: Number of subjects with adverse events (AEs), AEs leading to discontinuation, serious adverse events (SAEs), SAEs leading to discontinuation and death

End point title	Number of subjects with adverse events (AEs), AEs leading to discontinuation, serious adverse events (SAEs), SAEs leading to discontinuation and death
-----------------	--

End point description:

An AE was defined as any unfavorable and unintended sign, symptom, or disease temporally associated with the use of study drug, whether or not related to study drug. A SAE was defined as an event which was fatal or life threatening, required or prolonged hospitalization, was significantly or permanently disabling or incapacitating, constituted a congenital anomaly or a birth defect, or encompassed any other clinically significant event that could jeopardize the subject or require medical or surgical intervention to prevent one of the aforementioned outcomes. Treatment related AEs or SAEs were defined as AEs or SAEs that were suspected to be related to study treatment as per investigator. The analysis was performed in safety set I (SS I) population and SS II population defined as, all subject who received at least one dose of study drug and had at least one post-treatment safety assessment in Part I and Part II respectively.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline (start of study treatment) up to Week 88 (End of Part II)

<b>End point values</b>	ACZ885 (Part I)	ACZ885 (Part II)	Placebo (Part II)	
Subject group type	Reporting group	Reporting group	Reporting group

### Secondary: Number of subjects with anti-ACZ885 antibodies at any visit

End point title	Number of subjects with anti-ACZ885 antibodies at any visit
End point description:	
Immunogenicity was analyzed by using a bridging ELISA method. Anti-ACZ885 antibodies were captured in solution by combination of biotinylated and ruthenium-labeled forms of ACZ885. Complex formation was subsequently detected by Electro Chemi Luminescence using a Mesoscale Discovery streptavidin plate. The analysis was performed in safety set I (SS I) population and SS II population.	
End point type	Secondary
End point timeframe:	
Baseline up to Week 88 (End of Part II)

occurrences (all)	24	5	10

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 July 2009	Modified the criteria for which a subject discontinued due to flare in Part I, to that of not achieved ACR30 response or not maintained a minimum ACR30 response and the stable steroid dose level that allowed a subject to taper off steroids after 24 weeks in Part II was lowered to a threshold of > 0.2 mg/kg/day. The entry criteria for rollover subjects from the CACZ885G2305 and CACZ885A2203 studies was changed so that the requirement of intermittent fever and CRP > 30 mg/L was not applicable.
22 September 2009	Changes done to ensure subjects from the study CACZ885A2203 could continue to receive continuous treatment in subsequent phase III studies provided that the subject did not meet the discontinuation criteria of CACZ885A2203 or the safety discontinuation criteria of CACZ885G2301.
03 November 2009	Modified the study procedures in order to replace "absence of fever" in the secondary objectives with "body temperature $\leq 38^{\circ}\text{C}$ "; to ensure that subjects were on a stable dose of corticosteroids for at least 3 days prior to baseline; clarified the transition of CACZ885G2305 placebo subjects to the CACZ885G2301 study if they did not maintain a minimum ACR30 response between Days 15 and 29; and clarified the handling of CACZ885A2203 rollover subjects when there was a gap of at least 6 months between the subject's last dose in CACZ885A2203 and entry into CACZ885G2301.
19 January 2010	Modified the study procedures for the subjects who were doing well clinically, to avoid unnecessary exposure to higher steroid doses.
03 January 2011	Modified the criteria to describe the implementation of an adjudication committee for macrophage activation syndrome (MAS) and follow-up to be conducted on MAS cases identified during the study.
23 May 2011	Modified the criteria to introduce the possibility performing an interim analysis and adjusted the statistical hypothesis in the statistical methods section for Part I to be fully aligned with the objective.

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Due to EudraCT system limitations, which EMA is aware of, data using 999 as data points in this record are not an accurate representation of the clinical trial results. Please use <https://www.novctrd.com/CtrdWeb/home.novfor> for complete trial results.
