Paediatric regulatory details	
Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage	
Analysis stage	Final
Date of interim/final analysis	05 March 2013
Is this the analysis of the primary completion data?	Yes
Primary completion date	05 March 2013
Global end of trial reached?	Yes
Global end of trial date	23 June 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To determine objective response rate (ORR) (complete remission [CR] + partial remission [PR]) per modified International Working Group (IWG) Revised Response Criteria for Malignant Lymphomas.

Protection of trial subjects:

This clinical study was written, conducted and reported in accordance with the protocol, International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) Good Clinical Practice (GCP) Guidelines, and applicable local regulations, including the European Directive 2001/20/EC, on the protection of human rights, and with the ethical principles that have their origin in the Declaration of Helsinki. Astellas ensures that the use and disclosure of protected health information (PHI) obtained during a research study complies with the federal, national and/or regional legislation related to the privacy and protection of personal information.

Background therapy: -	
Evidence for comparator: -	
Actual start date of recruitment	08 March 2010
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	1 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Worldwide total number of subjects	43
EEA total number of subjects	32

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23	0

months)	
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	22
From 65 to 84 years	21
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This multicenter study was conducted at 35 sites; 16 sites in the United States (US), 8 sites in France, 6 sites in Spain, and 5 sites in the United Kingdom (UK).

Pre-assignment

Screening details:

A total of 52 participants were screened, 43 enrolled, 41 received treatment. Eligible participants received YM155 5.0 mg/m^2/day and Rituximab 375 mg/m^2. A participant was considered as having completed treatment if the patient met one of the discontinuation criteria.

Period 1 Period 1 title Overall Period (overall period) Is this the baseline period? Yes Allocation method Non-randomised - controlled

Not blinded

Blinding implementation details:

This section is not applicable since this is an open-label study.

Arms

Arm title	YM155 plus rituximab

Arm description:

Blinding used

Participants were administered YM155 and rituximab during 14-day cycles. Rituximab (375 mg/m^2) was administered weekly on days 1 and 8 during cycles 1 to 4, repeated every 10 cycles (i.e., cycles 11-14, 21-24, etc.). YM155 (5 mg/m^2 per day intravenously (IV)) was administered by continuous infusion for 168 hours via a central line, port or peripherally-inserted central catheter (PICC) from days 1 to 8 of each cycle.

Arm type	Experimental
Investigational medicinal product name	YM155
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Participants were administered YM155 during 14-day cycles. YM155 (5 mg/m^2 per day IV) was administered by continuous infusion for 168 hours via a central line, port or PICC from days 1 to 8 of each cycle. During cycles in which both YM155 and rituximab were administered, the YM155 infusion on day 1 was to be initiated within 1 hour following completion of the rituximab infusion. Each dose of YM155 was based upon body surface area (BSA), calculated using actual weight for participants with body mass index (BMI) < 30 kg/m^2 and adjusted (vs. actual) body weight for participants with BMI \geq 30 kg/m^2. If a participant gained weight leading to a BMI increase from < 30 to \geq 30 kg/m^2, then BSA was recalculated based upon the new, adjusted weight to determine if the YM155 dose should be increased. If the YM155 dose actually decreased (compared to original dose) when using the adjusted BSA, then the original dose of YM155 should have been utilized.

Investigational medicinal product name	Rituximab
Investigational medicinal product code	
Other name	Rituxan, Mabthera
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Participants were administered rituximab during 14-day cycles. Rituximab (375 mg/m^2) was administered weekly on days 1 and 8 during cycles 1 to 4, repeated every 10 cycles (i.e., cycles 11-14, 21-24, etc.). On day 8, the rituximab infusion could have been initiated during, but no later than 1 hour following the completion of, the YM155 infusion. If the rituximab infusion was initiated prior to the end of the YM155 infusion, a separate peripheral line in a different anatomical location must have been used.

Number of subjects in period 1	YM155 plus rituximab
Started	43
Treated	41
Completed	34
Not completed	9

Secondary: Number of participants with adverse events (AEs) End point title Number of participants with adverse events (AEs)

End point description:

Analysis population consisted of the Safety Analysis Set (SAF) population. The SAF was defined as all patients who received at least 1 dose of study regimen (rituximab or YM155). An adverse event (AE) is defined as any untoward medical occurrence in a subject administered a study drug or study regimen and which does not necessarily have a causal relationship with the treatment. An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of a study drug or study regimen, whether or not related to the study drug or study regimen. Treatment-emergent adverse event (TEAE) was defined as an AE starting after first administration of the study drug up to the End of Treatment Visit (ETV).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 June 2009	Remove the collection of tumor biopsy slides and bone marrow slides as inclusion criteria. Remove the requirement to collect tumor biopsy slides for biomarker analysis. Update the Events Always Considered to be Serious List. Remove the statement on the protocol cover page regarding legal representation of sponsor as stipulated under Directive 2001/20/EC of the European Parliament and of the Council.
21 January 2010	Clarify that registration was to occur as close as possible to day 1 of cycle 1. Update the National Cancer Institute – Common Terminology Criteria for Adverse Events (NCI-CTCAE) version. Update the Overall Response Rate to ORR. Update the primary variable definition. Update the safety variable in the synopsis to match the safety variable in the main protocol. Update the CR and PR variable definition. Add safety analysis after the 10th patient completed 1 cycle of YM155 plus rituximab treatment. Update inclusion criteria. Remove the acceptability of a legally authorized representative consenting on a patient's behalf. Update the inclusion/exclusion criteria. Add cycle 1 day 2 visit and a physical exam in the cycle 1 day 4 visit. Update the test drug storage condition. Highlight that generic rituximab could not be administered to study patients. Update the drug destruction and drug return requirement. Update the medical history and baseline condition definition. Update language regarding consistency in radiological review of scans and that diagnostic quality computed tomography (CT) scans were required. Update the lab assessment to include hepatitis tests. Update language to clarify that other staining methods such as, but not limited to, immunohistochemistry (IHC) could be conducted. Clarification on AE assessment and documentation. Update blood collection volumes. Update procedure in case of pregnancy. Update the statistical analysis. Appendices updated.
04 May 2010	Revise inclusion and exclusion criteria. Update the protocol introduction to include information that was then available in the Investigator's Brochure and clinical database for YM155. Allow for investigator discretion in lowering of the YM155 dose. Clarify the retreatment criterion regarding toxicities. Clarify AE descriptions for rituximab. Provide guidance for destroying or returning study drug. Provide guidance for administering growth factors. Revise the frequency of post-treatment imaging. Clarify the type of imaging used when contrast CT was contraindicated. Clarify how YM155 dose interruptions were to be handled Clarify procedures for administering rituximab and YM155. Clarify where medical history and baseline conditions were recorded on the case report form (CRF). Allow for dosing of rituximab and YM155 at the same time on day 8. Clarify statistical methodology.
12 July 2010	Clarify inclusion criterion regarding prior chemotherapy, prior malignancies and definition of relapse. Clarify biomarker testing. Clarify serious adverse event (SAE) reporting period.
07 July 2011	Delete all reference to Canada. Clarify accepted scans prior to informed consent. Update study timelines. Clarify inclusion criteria 5, 9, and 10. Add a window to the screening period CT and FDG-PET scans. Update statistical methods. Clarify what scans needed to be obtained after a PR/CR. Clarify YM155 dosing per patient's weight. Delete vital signs and electrocardiogram (ECG) on cycle 1, days 2 and 6. Add a window to the follow-up CT and magnetic resonance imaging (MRI) scans. Clarify the SAE capturing of agranulocytosis (myelosuppression). Add Drug-Induced Liver Injury (DILI) information. Clarify the minimum of days in each cycle. Add a window to allow scans obtained (±) 3 days at the 12-week follow-up visit.

	,
23 February 2012	Incorporate updated safety language. Update the planned study period. Decrease the sample size. The sample size was reduced from 60 to 40 patients based on the efficacy and safety data from interim analyses, which suggested that findings from 40 patients in this proof-of-concept study would be sufficient to plan subsequent studies. Delete specific assessments due to lack of safety alert signals. Decrease the estimated total amount of blood drawn based on fewer planned laboratory assessments. Update the imaging and statistical portion of the protocol to change the assessment of the primary endpoint to the Investigator
30 October 2012	Update the projected last patient out date. Clarify the criteria used for ORR. Remove the timeframe for inclusion criteria 1 (aged 18 years or older), as it was not applicable. Clarify patient assessment regarding life expectancy was based on investigator's judgment. Clarify adequate method of birth control. Clarify exclusion criteria 8. Clarify prohibited medications or therapies while on study. Update the 1) number of patients in the PPS and the number of observed ORR at final analysis, 2) number of non-progressing patients in the PPS, and 3) power and the observed ORR at final analysis, all to correspond with the updated PPS definition. Clarify when diagnostic CT and FDG-PET scans were performed. Clarify when patients were contacted during the survival follow-up period. Delete Appendix 10 (Events Always Considered to be Serious), as the listing was not mandated by regulations. Clarify timing of study termination if the study had to be closed for any reason. Clarify the version of CTCAE being used for the study. Include further instructions to Investigators for reporting protocol deviations to the Sponsor. Clarify best objective response in the event of a CR to a PR.
12 September 2013	Clarify the obligations for reporting SAEs. Ensure that the principal investigator's protocol acknowledgement adhered to country-specific regulations, as applicable. Update the current study period. Clarify the end of trial in the protocol. Update the number or timing of assessment to either clarify the data collection endpoint or to reflect standard of care. Include a systematic process for identifying and summarizing protocol deviations.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The primary analysis is considered final and no end of study report will be completed. The 7 ongoing participants at the time of the data cutoff are now completed.

EU-CTR publication date: 24 June 2016
