

Clinical trial results:

Randomised double blind placebo controlled pivotal study to evaluate efficacy and safety of rPhleum in adult and adolescent patients suffering from rhinoconjunctivitis +/- controlled asthma

Summary

EudraCT number	2009-011504-36
Trial protocol	DE GB PL FR ES
Global end of trial date	09 August 2013

Results information

Result version number	v1 (current)
This version publication date	03 November 2017
First version publication date	03 November 2017

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 September 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	09 August 2013
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To evaluate the hypothesis that the recombinant allergen preparation rPhleum is suitable for an efficacious SCIT in grass pollen allergic patients and that the trial product is sufficient to suppress allergic symptoms caused by natural grass pollen exposure. The trial medication was tested versus placebo.

The trial population consisted of patients (with or without controlled asthma) who had rhinoconjunctivitis caused by grass pollen. At the onset of the grass pollen season in the baseline year of the trial, the patients started their documentation of allergic symptoms and use of rescue medication in a patient's diary (nature and severity of symptoms, at the same time each day). This procedure was repeated during the following 2 seasons of the double-blind treatment period. Standardised diaries in local language were used, asking for details relevant for the statistical evaluation.

SCIT =Subcutaneous immunotherapy

Protection of trial subjects:

The study was conducted in accordance with the Declaration of Helsinki (October 2000 and following amendments), Good Clinical Practices guidelines, and local legal requirements. Other than routine care, no specific measures were implemented for the protection of trial subjects.

Aluminium levels in plasma and urine were measured before treatment, after up-dosing, after 1 year of treatment, at the final visit, and the follow-up visit (6 months after individual subject's last dose administration).

The cumulative amount of injected aluminium was calculated for each treatment year by summing up the aluminium dose [mg]. Aluminium values in blood plasma that were above 7.5 µg/L (International System of Units (SI): 0.278 µmol/L) were considered abnormal in this trial, based on the reference values from the study's central laboratory. The median aluminium values plasma at baseline were: 5.85 µg/L active treatment group; 6.10 µg/L placebo group.

During the up-titration a steady increase in plasma level for aluminium was seen, a steady-state was reached during the maintenance period; 6 months after discontinuation of the treatment, the aluminium levels returned to nearly the values observed at baseline. The aluminium analysis in urine did not yield any further clinically relevant data.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 February 2010
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	6 Months
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 95
Country: Number of subjects enrolled	Spain: 11
Country: Number of subjects enrolled	United Kingdom: 13
Country: Number of subjects enrolled	Germany: 76
Worldwide total number of subjects	195
EEA total number of subjects	195

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	13
Adults (18-64 years)	182
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Patients were recruited in study centers in several countries in Europe.

Overall, 806 subjects were screened for eligibility; of these, 195 subjects were randomised to treatment according to the exclusion and inclusion criteria.

Pre-assignment

Screening details:

Subjects were randomised to treatment according to the study specific exclusion and inclusion criteria.

Period 1

Period 1 title	Double blind phase (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Subject, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Active treatment (rPhleum)
Arm description: -	
Arm type	Experimental
Investigational medicinal product name	rPhleum
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Strength 1 (0.78 µg/mL); Strength 2 (6.25 µg/mL); Strength 3 (50 µg/mL); Strength 4 (200 µg/mL).

The investigational product (rPhleum), manufactured and supplied by Allergopharma, was a mixture of recombinant major allergens of Timothy Grass Pollen (Phleum pratense) adsorbed onto aluminium-hydroxide.

During the clinical trial, vials with four different concentrations were used:

At the beginning of the treatment, injections had to be administered in intervals of 7 (+ 7 days). The dose was increased progressively by one step at a time only, provided that the previous dose has been well tolerated. After the maximum individually tolerated dose (= maintenance dose) had been reached, the injection intervals were prolonged to 2, and finally 4 weeks (+ 2 weeks). During the grass pollen season the maintenance dose had to be reduced to 50% of the maximum individually tolerated dose. After the end of grass pollen season the dosage had to be re-adjusted again to 100%.

Arm title	Placebo
Arm description: -	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo in sterile suspension containing histamine dihydrochloride in 2 different strengths for subcutaneous injection in the upper arm. The placebo-preparation used was the verum-solution without

any allergen active substance.

Reporting group title	Placebo
Reporting group description: -	

Primary: 1_Change of the AUC of the ma-RC-SS; Change from baseline

End point title	1_Change of the AUC of the ma-RC-SS; Change from baseline
-----------------	---

End point description:

Change of the AUC: ma-RC-SS from baseline season to season after 1 and 2 treatment years.

AUC for each patient was calculated for the 42 day evaluation period (i.e. -10 days before peak pollen count until 31 days after peak pollen count). The peak pollen count for each centre was defined (BDRM), based on the actual pollen counts for the respective year.

Symptoms:

- Eyes (itching, tear flow, redness)
- Nose (sneezing, itching, running, blockage)
- Lungs (cough, wheezing, dyspnoea)

Score intensity:

0 = absent symptoms (no sign/symptom evident)

1 = mild symptoms, minimal inconvenience

2 = moderate, bothersome but tolerable symptoms

3 = severe symptoms that interfered with daily living activities

Daily medication scores: assigned as in AMS Scoring Conventions for Allergopharma clinical studies

AMS=Advanced Medical Services GmbH (CRO)

End point description:

Conjunctival provocation test

CPT reproduces the events occurring by instilling an allergen on the ocular surface.

A lyophilised 6 grass pollen allergen cocktail with a standardised activity to be reconstituted and diluted for the provocation test was supplied by Allergopharma. At the performance of the first test the initial concentration was 5 SBU/ml. After having applied the initial concentration a titration with increasing

concentrations was done until a positive test result was achieved. The highest possible concentration was 5000 SBU/ml.

End point title	10_European Quality of Life Questionnaire (EQ-5D) score; Change from baseline
-----------------	---

End point description:

European Quality of Life Questionnaire (EQ-5D) score; Change from baseline .

The scores from the EQ-5D were used with the patient's time from first treatment to end of trial as a measure of disease burden. The EQ-5D score was derived from the answers to the five questions using the utility (value set) of the UK population.

Questions for EQ-5D were: Mobility, Self-care, Usual activity, Pain/discomfort, Anxiety/Depression
The score scale was from 1 to 3 (For full health i.e. health state 11111, the EQ-5D score was 1).

The actual number of patients contributing data for this evaluation is shown within the results table.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
16 August 2012	<ul style="list-style-type: none">• Altered the primary endpoint to change of the area under the curve (AUC) of the medication-adjusted Rhinoconjunctivitis Symptom Score (ma-RC-SS) from the baseline season to the season after 2 years of treatment. The former primary endpoint (change of AUC of the Rhinoconjunctivitis Symptom-Medication-Score [RC-SMS] after 2 years) became an additional secondary endpoint.• Added additional safety laboratory assessments for aluminium, at the final visit of the treatment phase as well as 6 months after the last individual application of trial medication.• Specified parameters: IgE and IgG.• Added as secondary endpoints: changes of rhinoconjunctivitis symptom score, rhinoconjunctivitis medication score, symptom score and medication score after 1, 2, and 3 years.• Added as a secondary endpoint: change of AUC of the medication-adjusted Rhinoconjunctivitis Symptom Score (ma-RC-SS) after 1 and 3 years.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No
