Analysis stage	Final
Date of interim/final analysis	08 July 2015
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	08 July 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

This randomized, open-label study evaluated the efficacy, safety and tolerability of vemurafenib (RO5185426) as compared to dacarbazine in previously untreated subjects with metastatic melanoma. Subjects were randomized to receive either vemurafenib 960 mg orally twice daily or dacarbazine 1000 mg/m² intravenously every 3 weeks. Anticipated time on study treatment was until occurrence of disease progression or unacceptable toxicity. Subjects in the dacarbazine arm were permitted to cross over to vemurafenib treatment.

Protection of trial subjects:

All study participants were required to read and sign an Informed Consent Form.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 January 2010
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Adults (18-64 years)	513
From 65 to 84 years	157
85 years and over	4

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

675 participants were randomized. One participant randomized to dacarbazine was treated in error with vemurafenib throughout the study and is included in the Vemurafenib arm in the table below and for exposure and safety analyses and is included in the dacarbazine arm for efficacy analyses.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Vemurafenib

Arm description:

Participants received continuous oral doses of vemurafenib (RO5185426) 960 mg twice a day. Participants took four 240 mg tablets in the morning and four 240 mg tablets in the evening (960 mg twice a day for a total daily dose of 1920 mg).

Arm type	Experimental
Investigational medicinal product name	Vemurafenib
Investigational medicinal product code	
Other name	Zelboraf®, RO5185426
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

960 mg (4 x 240 mg tablets) twice daily

Arm title	Dacarbazine
------------------	-------------

Arm description:

Dacarbazine was administered intravenously 1000 mg/m² up to 60 minutes on Day 1 of every 3 weeks (3 weeks was one cycle length).

Arm type	Active comparator
Investigational medicinal product name	Dacarbazine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

1000 mg/m² up to 60 minutes on Day 1 of every 3 weeks

Number of subjects in period 1	Vemurafenib	Dacarbazine
Started	337	338
Treated	336	293
Completed	0	0
Not completed	337	338
Withdrawal of Consent	4	6
Protocol violation	2	3
Randomized but not treated	1	45
Adverse event, non-fatal	25	5
Refuse Treatment	9	6
Death	13	12
Reason Not Specified	26	43
Progression	257	218

Baseline characteristics

Reporting groups

Primary: Overall Survival

End point title	Overall Survival
End point description: An Overall survival event was defined as death due to any cause. The number of participants with overall survival events is reported. The intent-to-treat (ITT) population was defined as all randomized participants, whether or not study treatment was received. The ITT population was analyzed according to the treatment assigned at randomization. Overall survival was assessed on participants randomized at least 15 days prior to the clinical cutoff date of December 30, 2010.	
End point type	Primary
End point timeframe: From randomization (initiated January 2010) to December 30 2010. Median follow-up time in the vemurafenib group was 3.75 months (range 0.3 to 10.8) and in the dacarbazine group was 2.33 months (range <0.1 to 10.3).	

End point values	Vemurafenib	Dacarbazine		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	336	336		
Units: participants				
number (not applicable)				
Participants with events	43	75		
Participants without events	293	261		

Statistical analyses

Statistical analysis title	Statistical analysis - Overall Survival
Statistical analysis description: The trial had a power of 80% to detect a hazard ratio of 0.65 for overall survival with an alpha level of 0.045 (an increase in median survival from 8 months for dacarbazine to 12.3 months for vemurafenib), one interim analysis for overall survival at 50% information. The hazard ratio for death for vemurafenib relative to dacarbazine and the associated 95% confidence interval were computed using an unstratified Cox regression model.	

Comparison groups	Vemurafenib v Dacarbazine
Number of subjects included in analysis	672
Analysis specification	Pre-specified
Analysis type	other
P-value	< 0.0001
Method	Logrank
Parameter estimate	Hazard ratio (HR)
Point estimate	0.37
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.26
upper limit	0.55

Primary: Progression-free Survival

End point title	Progression-free Survival
-----------------	---------------------------

End point description:

A progression-free survival (PFS) event was defined as disease progression or death due to any cause. Tumor response (progression) was assessed according to the Response Evaluation Criteria In Solid Tumors (RECIST) version 1.1 criteria using computed tomography (CT) scans or magnetic resonance imaging (MRI).

The analysis population for PFS consisted of all ITT participants randomized by October 27, 2010 (at least 9 weeks prior to the clinical cutoff date of December 30, 2010). The 9-week interval was chosen to allow time for participants to have had their first scheduled post baseline tumor assessment CT scan.

End point type	Primary

Secondary: Participants with a Best Overall Response (BOR) of complete response or partial response

End point title	Participants with a Best Overall Response (BOR) of complete response or partial response
-----------------	--

End point description:

BOR was defined as a complete response (CR) or partial response (PR) confirmed per Response Evaluation Criteria In Solid Tumors (RECIST) version 1.1. Participants who never received study treatment and treated participants without any post-baseline tumor assessments were considered as non-responders. CR: Disappearance of all target lesions, all non-target lesions and no new lesion. Any pathological lymph nodes must have had reduction in the short axis to <10 mm. PR: At least a 30% decrease in the sum of diameters of target lesions, no progression in non-target lesion and no new lesion.

The analysis population consisted of all ITT participants randomized by September 22, 2010 (at least 14 weeks prior to the clinical cutoff date of December 30, 2010). The 14-week interval was chosen as it was the minimum time needed to observe a confirmed overall response according to protocol-specified schedule for the first two tumor assessments.

End point type	Secondary

Responders	106	12		
Non-responders	113	208		

Statistical analyses

No statistical analyses for this end point

Secondary: Duration of response

End point title	Duration of response
-----------------	----------------------

End point description:

Duration of response was defined as the time between the date of the earliest qualifying response and the date of disease progression or death due to any cause. Duration of response was calculated only for participants who had a best overall response of Complete Response or Partial Response and was estimated using the Kaplan–Meier method.

The analysis population included all participants randomized by September 22, 2010 and with a best overall confirmed response of complete response or partial response.

999 = Median duration of response was not reached as only 2 of the 12 participants with a qualifying response had subsequent disease progression or death due to any cause at the time of the analysis.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization (initiated in January 2010) until December 30, 2010.

Secondary: Number of participants with adverse events (AEs)

End point title	Number of participants with adverse events (AEs)
End point description:	
The intensity of AEs was graded according to the NCI Common Terminology Criteria for Adverse Events v 4.0 (CTCAE) on a five-point scale (Grade 1 to 5: Mild, Moderate, Severe, Life-threatening and Death). A serious adverse event is any experience that suggests a significant hazard, contraindication, side effect or precaution, for example is life-threatening, requires hospitalization, results in persistent or significant disability/incapacity, is a congenital anomaly/birth defect or requires intervention to prevent one or other of the outcomes listed above.	
The safety population was defined as all treated participants who had at least one on-study assessment. The safety population was analyzed according to the treatment received.	
End point type	Secondary

End point timeframe:

From randomization (initiated January 2010) until December 30, 2010.

Serious adverse event	110	45		

Statistical analyses

No statistical analyses for this end point

Secondary: Pre and Post-dose Plasma vemurafenib Concentration by Study Day

End point title	Pre and Post-dose Plasma vemurafenib Concentration by Study Day ^[3]
-----------------	--

End point description:

The pharmacokinetics of vemurafenib were assessed at the beginning of each 21-day cycle using predose and 2-4 hours post-dose sampling.

The pharmacokinetic (PK) analysis population included all participants who received vemurafenib and provided valid PK assessments. The PK population at specific time points varied depending on the availability of confirmed dosing and PK assessment times. "n" indicates the number of participants with available PK data at each time point.

End point type	Secondary
----------------	-----------

End point timeframe:

Plasma samples were collected before the morning dose (troughs) and 2-4 hours after the morning dose at the beginning of each cycle (Days 1, 22, 43, 64, 106, 148 and 190).

Notes:

[3] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Descriptive analysis was performed.

Reporting groups

Reporting group title	Vemurafenib
-----------------------	-------------

Reporting group description:

Adverse events reported for this group include those occurring in participants receiving vemurafenib starting at their baseline visit.

Participants received continuous oral doses of vemurafenib (R05185426) 960 mg twice a day.

Participants took four 240 mg tablets in the morning and four 240 mg tablets in the evening (960 mg twice a day for a total daily dose of 1920 mg).

Reporting group title	Dacarbazine
-----------------------	-------------

Reporting group description:

Adverse events reported for this group include those occurring in participants receiving dacarbazine starting at their baseline visit until study discontinuation or treatment switch.

Dacarbazine was administered intravenously 1000 mg/m² up to 60 minutes on Day 1 of every 3 weeks (3 weeks was one cycle length).

Reporting group title	Vemurafenib After Crossover
-----------------------	-----------------------------

Reporting group description:

Adverse events reported for this group include those occurring following switch to vemurafenib in those participants who switched from dacarbazine to vemurafenib during the study.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
08 June 2010	<ul style="list-style-type: none"> • Clarified information on the BRAF analysis and the process for the BRAF mutation analysis. • Clarified the timing of clinical assessments and procedures and reorganized them to match the new schedule of assessments. • For patients for whom a computerized tomography (CT) scan was contraindicated, a clarification was added that a magnetic resonance imaging (MRI) scan could be used for assessment of non-cutaneous squamous cell carcinoma (SCC) surveillance. • Added information about the length of acceptable delay/interruption in vemurafenib dosing to clarify when interruptions/delays occur depending on the grade of adverse events (AEs). • Clarified that all SCC events should be reported as SAEs.
01 November 2010	<ul style="list-style-type: none"> • Changed the estimated treatment effect of vemurafenib as measured by the hazard ratio for death from 0.75 to 0.65 due to emerging results from Phase 1 and 2 studies; with the change in the type 1 error rate, this resulted in a reduction in the number of deaths required for final analysis from 468 to approximately 196. • Changed the number of interim analyses for OS from two (at 50% and 75%) to one (at 50% information). • Added PFS as a co-primary endpoint and as part of the study's primary objective. • Changed the type 1 error rate for the study from 0.025 (two-sided) to 0.05 (two-sided). • Added allowance for crossover from the dacarbazine arm to the vemurafenib arm if recommended by the DSMB based on their review of efficacy data at the time of the interim analysis of OS.
16 February 2011	<ul style="list-style-type: none"> • Added allowance for crossover from the dacarbazine group to the vemurafenib group for all patients on dacarbazine with a wash-out period of 14 days. Crossover from the vemurafenib group to the dacarbazine group was disallowed. • Added cautions for concomitant medications: for potential drug-drug interactions with any concomitant medications that are primarily metabolized by the CYP450 1A2, 3A4 and 2C9, those that strongly inhibit or induce CYP3A4, and for medications and supplements that may affect QT interval prolongation. • Increased monitoring of ECG and electrolytes before initiating treatment with vemurafenib and during treatment, as well as recommendations to manage potential QTc prolongation. • Added evaluation and assessment of molecular characteristics of suspicious lesions in addition to the evaluation of cuSCC.
19 June 2012	<ul style="list-style-type: none"> • Risk Management Plan was revised with new timelines for SCC (both cutaneous and noncutaneous) follow-up, which was to occur during the treatment period and up to a maximum of 6 months after last dose during follow-up. • Tissue samples of any new primary neoplasm or SCC (cutaneous or noncutaneous) were to be submitted a central pathology laboratory for molecular characterization. • Serious AEs (SAEs) section was updated as follows: Keratoacanthoma, basal cell carcinoma, and any occurrence of a new primary malignancy were added as reportable SAEs. SAE reporting requirements were changed from reporting them within 1 working day to reporting them within 24 hours of knowledge of the event. • Gamma-glutamyltransferase (GGT) was added to Laboratory Assessments. The assessment had been ongoing in the study but was not documented in previous versions of the protocol. • Safety monitoring intervals for the DSMB changed and were outlined in the DSMB Charter.

01 December 2012	<ul style="list-style-type: none"> • Timing of PK sampling was clarified (patients receiving vemurafenib in Arm A only). Plasma and serum biomarker samples were to be obtained at disease progression or on the same day as the final dose of study treatment, whichever occurred first. • Timing of the optional biopsy at disease progression was clarified. • Dermatological evaluation was updated to include secondary primary melanoma consistently throughout the protocol.
21 April 2014	<ul style="list-style-type: none"> • The Sponsor was permitted to end the current study and permit eligible patients still receiving vemurafenib treatment to be offered enrollment in the extension study (Study GO28399). • Safety information was updated for cutaneous SCC (cuSCC), liver function abnormalities and liver-related AEs, and neutropenia in patients treated with vemurafenib. • Safety information was included for cases of adenomatous colonic polyps, NRAS-mutated chronic myelomonocyte leukemia, Stevens-Johnson syndrome, toxic epidermal necrolysis, and drug reactions with eosinophilia and systemic symptoms syndrome. • Information on the effects of vemurafenib on QT interval from Study NP22657 was included.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
