

Clinical trial results:

A randomized, double blind, parallel-group study with use of budesonide/formoterol “as needed”, or terbutaline “as needed” or regular use of budesonide + terbutaline “as needed”, in patients mild intermittent asthma and exercise induced bronchoconstriction.

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	03 May 2011
Is this the analysis of the primary completion data?	Yes
Primary completion date	03 May 2011
Global end of trial reached?	Yes
Global end of trial date	03 May 2011
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to evaluate the protective effect of the combination of budesonide and formoterol on an as needed basis compared to as needed use of terbutaline on EIB in adults and adolescents with mild intermittent asthma. This was evaluated by measuring maximum post-exercise fall in FEV1 before and after 6 weeks of treatment.

Protection of trial subjects:

The final Study Protocol, including the final version of the Master Informed Consent Form, was approved or given a favourable opinion in writing by an Independent Ethics Committee (IEC). The participating physicians were to submit written approval to AstraZeneca before they enrolled any patient into the Study, as local regulations require.

The participating physician at each centre ensured that the patient and, if applicable, parent/legal guardian was given full and adequate oral and written information about the nature, purpose, possible risk and benefit of the Patient Follow-up Programme. They were notified that it was possible to discontinue from the programme at any time and were given the opportunity to ask questions and allowed time to consider the information provided.

The participating physician obtained and documented the patient's or the legal guardians signed and dated informed consent before conducting any procedure specifically for the study.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	25 September 2009
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

On Visit 1, a total of 189 patients, aged 12-67, were enrolled at 10 study sites in 2 countries: Sweden and Norway. Of 189 enrolled patients, 66 patients were randomized and allocated to study treatment on Visit 3 (7 patients in Norway and 59 patients in Sweden).

Pre-assignment

Screening details:

A standardized exercise test (ECT) with duration of 6 minutes, at approximately 90% of maximal aerobic capacity (as defined on Visit 1) was performed on a treadmill while breathing dry air on Visit 2. Patients with exercised induced bronchoconstriction (defined as fall in FEV1 \geq 10%) could be randomized on Visit 3.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer, Data analyst, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Budesonide/terbutaline

Arm description:

Budesonide once daily and terbutaline before exercise and as needed

Arm type	Experimental
Investigational medicinal product name	Budesonide 400 + terbutaline 0.4 mg as needed
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

Budesonide 400 + terbutaline 0.4 mg as needed

Arm title	Terbutaline
------------------	-------------

Arm description:

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse events were collected from the enrolment visit (visit 1) until visit 6 (42 days after randomisation). Only AEs occurring on or after first dose of study medication are included in the summaries below.

Adverse event reporting additional description:

A total of 27 patients reported non-serious adverse events; 8 on Budesonide/terbutaline, 9 on Terbutaline, 10 on Budesonide/formoterol. Numbers for non-serious AEs in the reporting group table are based on the 5% threshold frequency.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 July 2009	Further explanations/ changes regarding the Maximal exercise test, ECT and Mannitol challenge. The leaning would not be more than up to 10% during the aximal exercise test. The standardized exercise test would be at 90% of maximal aerobic capacity instead of 80%, since this were active patients and well trained. The measurement of FEV1 at baseline (pre test) would always be 3, but during a test this was too much for the patient, and therefore we made these changes. ATS had new guidelines regarding FENO - measurement. It was enough with 2 measurements instead of 3. Clarification regarding leukotriene antagonists taken before randomisation was needed
11 December 2009	Clarification regarding coffee and other drinks with caffeine before visits. A clarification regarding which reference value should be used for children since European Community for Steel and Coal is limited to adults. A reversibility test will be allowed at visit 1 for those patients with FEV1 $\geq 75.0\%$ but $< 80.0\%$ of predicted normal value. Since most of the sites are using NIOX MINO, the text regarding the service is not applicable.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
