Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
--	----

Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 October 2017
Is this the analysis of the primary completion data?	Yes
Primary completion date	07 March 2017
Global end of trial reached?	Yes
Global end of trial date	07 March 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To determine the safety and tolerability of a standardized frankincense extract ("Boswelan") in subjects with multiple sclerosis or clinically isolated syndrome

Protection of trial subjects:

Patients were regularly and frequently monitored by clinical visits, laboratory parameters and magnetic resonance imaging. An independent data-safety monitoring board of three international Multiple Sclerosis experts followed all adverse events up during the trial.

The study protocol and the trial was conducted by treating and examining all patients in accordance with the national (German) applicable laws, the international guidelines on good clinical practice (ICH-GCP), and the declaration of Helsinki.

Further details are given in the study protocol (available via klarissa.stuerner@uksh.de).

Background therapy:

best medical care

Evidence for comparator:

in-vitro data inhibiting TH17 polarization in Multiple Sclerosis patients in cell culture

Actual start date of recruitment	01 September 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 38
Worldwide total number of subjects	38
EEA total number of subjects	38

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	38
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Multiple Sclerosis patients between 18 and 55 years were recruited at the UK Hamburg Eppendorf, Department of neurology or at the NeuroCure Research Center at the Charité Berlin. Of 80 screened patients 38 patients were enrolled to the trial.

Further details can be found at: <https://jnnp.bmj.com/content/89/4/330>

Pre-assignment

Screening details:

Subjects with clinically isolated syndrome (CIS) or clinically definite relapsing remitting multiple sclerosis (RRMS) fulfilling MRI inclusion criteria who either failed standard treatment by clinical measures or were not eligible for any of the standard treatments were given the opportunity to participate in the trial.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	Single Arm
-----------	------------

Arm description:

We performed an investigator-initiated, bicentric phase IIa, open-label, baseline-totreatment pilot study with an oral SFE in patients with RRMS. After a 4-month baseline observation phase, patients were treated for 8 months with an option to extend treatment for up to 36 months. The primary outcome measures were the number and volume of contrast-enhancing lesions (CEL) measured in MRI during the 4-month treatment period compared with the 4-month baseline period. Eighty patients were screened at two centres, 38 patients were included in the trial, 28 completed the 8-month treatment period and 18 of these participated in the extension period.

Arm type	Experimental
Investigational medicinal product name	standardised frankincense extract (SFE)
Investigational medicinal product code	
Other name	SFE
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

The SFE was provided as capsules containing 400 mg. After a 3-month baseline observation phase (stage 1) the patient participated in an individualised dose-finding phase (stage 2) during the first 8 weeks. Stage 2 was divided into two parts. In part 1, up to 400 mg capsules of an SFE were used to titrate up to a maximum well-tolerated dose or to a maximum of 4800 mg/day (whichever occurred first), that is, 1600 mg three times a day in the first 28 days by adding one capsule every second or third day. After the individual maximum well-tolerated dose had been determined, the patients continued with that dose for another 28 days (part 2) for stabilisation and to assess tolerability. This was followed by 6 months of continuous treatment at this dose (stage 3). A minimum tolerated dose of 2400 mg/day was mandatory to continue with the trial. If a relapse occurred during the study, the patients were offered the option to discontinue the trial and revert to standard treatment.

Number of subjects in period 1	Single Arm
Started	38
completed month 8	28
Completed	28
Not completed	10
Consent withdrawn by subject	3
Physician decision	4
non-compliance to protocol	3

Reporting groups

Reporting group title	SFE treated patients
-----------------------	----------------------

Reporting group description:

all patients included in the trial who participated in the treatment phase (even if only for hours or days); so anyone who has been exposed is reported here.

Serious adverse events	SFE treated patients		
Total subjects affected by serious adverse events			
subjects affected / exposed	4 / 38 (10.53%)		
number of deaths (all causes)	0		
number of deaths resulting from adverse events	0		
Injury, poisoning and procedural complications			
Broken ankle	Additional description: Broken ankle after accidental fall after 27 months of SFE intake		
subjects affected / exposed	1 / 38 (2.63%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Tibia fracture	Additional description: Tibia fracture during sports		
subjects affected / exposed	1 / 38 (2.63%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Immune system disorders			
Lupus vasculitis	Additional description: Newly diagnosed Lupus erythematoses after 25 months of SFE intake		
subjects affected / exposed	1 / 38 (2.63%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		
Gastrointestinal disorders			
Anal fissure	Additional description: need for emergency proctological procedure after diarrhea (infectious, had been acquired abroad in Asia)		

subjects affected / exposed	1 / 38 (2.63%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		

Frequency threshold for reporting non-serious adverse events: 0 %

Non-serious adverse events	SFE treated patients		
Total subjects affected by non-serious adverse events			
subjects affected / exposed	34 / 38 (89.47%)		
Gastrointestinal disorders			
diarrhea, gastric pain, stomach ache			
subjects affected / exposed	32 / 38 (84.21%)		
occurrences (all)	32		
Infections and infestations			
common cold			
subjects affected / exposed	26 / 38 (68.42%)		
occurrences (all)	26		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
23 April 2015	substantial amendment and new patient information (due to information about 2 cases of rheumatic disease in the trial and further information on estragole)

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

no placebo cohort; this was only a pilot trial using a baseline-to-treatment design
