

## Clinical trial results:

### Parent-determined oral montelukast therapy for preschool wheeze with stratification for arachidonate-5-lipoxygenase (ALOX5) promoter genotype.

#### Summary

EudraCT number	2009-015626-11
Trial protocol	GB
Global end of trial date	31 October 2014

#### Results information

Result version number	v1 (current)
This version publication date	27 August 2017
First version publication date	27 August 2017
Summary attachment (see zip file)	EME Report - WAIT Study (Nwokoro et al. - 2015 - Parent-determined oral montelukast therapy for preschool wheeze with stratification for arachidonate 5-lipoxygen.pdf) Main Publication (LANCET PAPER.pdf) Qualitative Paper (e002750.full.pdf)

#### Trial information

##### Trial identification

Sponsor protocol code	006983 QM
-----------------------	-----------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT01142505
WHO universal trial number (UTN)	-
Other trial identifiers	NIHR-EME Project Number: 08/43/03, NHS Research Ethics Committee Number: 09/H1102/110

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No
--	----

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 January 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	31 December 2013
Global end of trial reached?	Yes
Global end of trial date	31 October 2014
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The principal objective of this research is to determine whether intermittent parent-initiated treatment with oral montelukast in preschool children with a history of wheeze, reduces the need for unscheduled medical attention for wheeze. To assess this treatment will be started by parents or guardians i) at the onset of every cold and continued for a minimum of 7 days or until wheeze has resolved for 48 hours, and ii) for every episode of wheeze not associated with a viral cold, and stopped when symptoms have resolved for 48 hours. For each child, the trial will last 12 months.

Protection of trial subjects:

Study was conducted under auspices of an IDMC, and the NHS Research Ethics Committee. All subjects were recruited by their treating medical physician. The investigational medicinal product is already in full licensed use for the indication under study. There were no painful interventions involved in the study.

Background therapy:

Children were under standard treatment for asthma and wheezing disease such as inhaled steroids or beta agonist. These were not imposed as part of study protocol.

Evidence for comparator:

This information is included in the study design section of the report. The comparator was an identical placebo, while the IMP was a known drug used in paediatric asthma.

Actual start date of recruitment	01 October 2010
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 1346
Worldwide total number of subjects	1346
EEA total number of subjects	1346

Notes:

### Subjects enrolled per age group

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	463
Children (2-11 years)	883
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Participants were identified in primary and secondary care centres. Recruitment was planned to encompass only three secondary care centres (the Royal London Hospital, University Hospital Leicester and the Royal Aberdeen Children's Hospital), but increased to 41 secondary care centres in England and Scotland. Recruitment spanned Oct 2010 to Dec 2012

### Pre-assignment

Screening details:

Eligibility: 10m-5y, >1 wheeze attacks, 1 medically validated, 1 in prev 3m. Exclusions: respiratory comorbidities, sickle cell, BPD, severe developmental delay, montelukast use, other recent trial involvement. 1883 screened, 525 did not ultimately consent, 11 subsequently refused permission for data use, 1 provided no data --> 1346.

### Pre-assignment period milestones

Number of subjects started	1883 <sup>[1]</sup>
Intermediate milestone: Number of subjects	Consent: 1366
Intermediate milestone: Number of subjects	Randomisation: 1358
Number of subjects completed	1346

### Pre-assignment subject non-completion reasons

Reason: Number of subjects	Refused consent: 517
Reason: Number of subjects	No data collected: 1
Reason: Number of subjects	Withdrew prior to randomisation: 8
Reason: Number of subjects	Withdrew permission to use collected data: 11

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: This number (1883) includes all those approached to enter the study.

### Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

Novalabs (the primary IMP producer) produced a corresponding randomisation code denoting whether a given IMP box contained active medication or placebo. This was kept sealed and held only by the clinical trials pharmacist and a member of the Independent Data and Safety Monitoring Committee (DSMC), in this way all other clinical investigators and participants remained blinded to treatment allocation.

### Arms

Are arms mutually exclusive?	Yes
Arm title	Active Treatment
Arm description:	
Subjects allocated to active treatment	
Arm type	Experimental

Investigational medicinal product name	Singulair granules
Investigational medicinal product code	ATC code: R03DC03
Other name	Montelukast
Pharmaceutical forms	Granules in sachet
Routes of administration	Oral use

**Dosage and administration details:**

IMP was presented as white granules administered either directly into the child's mouth, or mixed with a spoonful of cold or room temperature soft food. The IMP was used according to the primary manufacturer's instructions. Specifically, parents were advised not to open the sachet containing the granules until ready to use. After opening the sachet, the full dose of granules was administered within 15 minutes. If mixed with food, the granules must not be stored for future use. The granules were not intended to be dissolved in liquid for administration however liquids could be taken subsequent to administration. The granules were administered without regard to the timing of food ingestion. The dose was one 4mg sachet per day, started at the start of a viral cold or had wheeze, and stopped after 10 days. Children could start a 2nd course should the wheeze persist. If a child vomited after receiving IMP no additional dose was given, and parents recorded this on the diary card.

<b>Arm title</b>	Placebo
------------------	---------

**Arm description:**

Subjects allocated to receive placebo during the study

Arm type	Placebo
Investigational medicinal product name	Mannitol EP (Pearlitol SD 200)
Investigational medicinal product code	N/A
Other name	
Pharmaceutical forms	Granules in sachet
Routes of administration	Oral use

**Dosage and administration details:**

IMP was presented as white granules administered either directly into the child's mouth, or mixed with a spoonful of cold or room temperature soft food. The IMP was used according to the primary manufacturer's instructions. Specifically, parents were advised not to open the sachet containing the granules until ready to use. ## Statistical analyses

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo - unstratified
-----------------------------------	---

Statistical analysis description:

Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects.

Comparison groups	Active Treatment v Placebo
Number of subjects included in analysis	1308
Analysis specification	Pre-specified
Analysis type	superiority <sup>[3]</sup>
P-value	= 0.06
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio
Point estimate	0.88

Confidence interval	
level	95 %
sides	2-sided
lower limit	0.77
upper limit	1.01
Variability estimate	Standard deviation

Notes:

[3] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo (5/5)
-----------------------------------	------------------------------------

Statistical analysis description:

Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in the 5/5 promoter polymorphism genotype arm.

Comparison groups	5/5 ALOX5 stratum - active v 5/5 ALOX5 stratum - placebo
Number of subjects included in analysis	814
Analysis specification	Pre-specified
Analysis type	superiority <sup>[4]</sup>
P-value	= 0.01 <sup>[5]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio
Point estimate	0.8
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.68
upper limit	0.95
Variability estimate	Standard deviation

Notes:

[4] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[5] - P-value for interaction between genotype and treatment is 0.08 (non-significant).

<b>Statistical analysis title</b>	USMA:Montelukast vs Placebo [5/x + x/y]
-----------------------------------	---

Statistical analysis description:

Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in the [5/x + x/y] promoter polymorphism genotype arm.

Comparison groups	5/x + x/y stratum - active v 5/x + x/y stratum - placebo
Number of subjects included in analysis	494
Analysis specification	Pre-specified
Analysis type	superiority <sup>[6]</sup>
P-value	= 0.79 <sup>[7]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio
Point estimate	1.03

Confidence interval	
level	95 %
sides	2-sided
lower limit	0.83
upper limit	1.29
Variability estimate	Standard deviation

Notes:

[6] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[7] - P-value for the interaction of genotype (5/5 vs [5/x +x/y]) with the primary outcome = 0.08 (non-significant).

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo (5/5 + 5/x)
-----------------------------------	--

Statistical analysis description:

Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in the (5/5 + 5/x) promoter polymorphism genotype arm.

Comparison groups	5/5 + 5/x stratum - active v 5/5 + 5/x stratum - placebo v x/y stratum - Active v x/y stratum - placebo
Number of subjects included in analysis	1297
Analysis specification	Pre-specified
Analysis type	superiority <sup>[8]</sup>
P-value	= 0.93 <sup>[9]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio in each arm
Variability estimate	Standard deviation

Notes:

[8] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[9] - P-value for interaction between genotype and treatment is 0.93 (non-significant).

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo (x/y)
-----------------------------------	------------------------------------

Statistical analysis description:

Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in the (x/y) promoter polymorphism genotype arm.

Comparison groups	5/5 + 5/x stratum - active v 5/5 + 5/x stratum - placebo v x/y stratum - Active v x/y stratum - placebo
Number of subjects included in analysis	1297
Analysis specification	Pre-specified
Analysis type	superiority <sup>[10]</sup>
P-value	= 0.93 <sup>[11]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio in each arm
Variability estimate	Standard deviation

Notes:

[10] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[11] - P-value for interaction between genotype and treatment is 0.93 (non-significant).

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo (ICS at baseline)
Statistical analysis description: Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in children with or without Inhaled Corticosteroids (ICS) at baseline.	
Comparison groups	ICS - Active v ICS - Placebo v No ICS - Active v No ICS - Placebo
Number of subjects included in analysis	1297
Analysis specification	Pre-specified
Analysis type	superiority <sup>[12]</sup>
P-value	= 0.09 <sup>[13]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio in each arm
Variability estimate	Standard deviation

Notes:

[12] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[13] - P-value for interaction between inhaled steroid use and treatment is 0.09 (non-significant).

<b>Statistical analysis title</b>	USMA: Montelukast vs Placebo (MTW vs EVW)
Statistical analysis description: Unscheduled Medical Attendances in Montelukast-treated subjects compared with Placebo-treated subjects in children with multiple trigger wheeze (MTW) vs Episodic Viral Wheeze (EVW) at baseline.	
Comparison groups	Multi trigger wheeze - active v Multi trigger wheeze - placebo v Episodic viral wheeze - active v Episodic viral wheeze - placebo
Number of subjects included in analysis	1297
Analysis specification	Pre-specified
Analysis type	superiority <sup>[14]</sup>
P-value	= 0.19 <sup>[15]</sup>
Method	Poisson Regression
Parameter estimate	Incidence Rate Ratio in each arm
Variability estimate	Standard deviation

Notes:

[14] - Data are analysed using Poisson regression with fixed effects for stratification factor and treatment group, a random effect for individual to account for overdispersion with follow up time fitted as the exposure. Follow up time is based on time from randomisation until either 12 month end of trial date or date of last phonecall. Primary outcome data is taken from the phonecall which occurred every two months, and confirmed from diary cards and primary and secondary care records.

[15] - P-value for interaction between wheeze phenotype (EVW vs MTW) and treatment is 0.19 (non-significant).

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Adverse events were reportable for one year from the point of trial entry

Adverse event reporting additional description:

Adverse events were reported on the diary card completed during courses of IMP and sent to the lead centre, reported in the two-monthly telephone questionnaire completed throughout follow-up, or reported as they occurred by telephone to the local research nurse. They were analysed by the local Principal Investigator.

Assessment type	Systematic

Gastrointestinal	Additional description: Any GI disturbance Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.		
subjects affected / exposed	86 / 669 (12.86%)	122 / 677 (18.02%)	
occurrences (all)	86	122	
Respiratory, thoracic and mediastinal disorders			
Respiratory	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.		
subjects affected / exposed	34 / 669 (5.08%)	54 / 677 (7.98%)	
occurrences (all)	34	54	
Skin and subcutaneous tissue disorders			
Cutaneous	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.		
subjects affected / exposed	32 / 669 (4.78%)	53 / 677 (7.83%)	
occurrences (all)	32	53	
Renal and urinary disorders			

Genitourinary	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.		
	subjects affected / exposed	10 / 669 (1.49%)	6 / 677 (0.89%)
	occurrences (all)	10	6
Musculoskeletal and connective tissue disorders			
	Musculoskeletal	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.	
	subjects affected / exposed	0 / 669 (0.00%)	1 / 677 (0.15%)
	occurrences (all)	0	1
Infections and infestations			
	Upper respiratory tract infection	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.	
	subjects affected / exposed	73 / 669 (10.91%)	103 / 677 (15.21%)
	occurrences (all)	73	103
	Minor infection	Additional description: Number of subjects affected is unknown, only number of occurrences. For purposes of data entry presumption of one occurrence per subject is made.	
	subjects affected / exposed	87 / 669 (13.00%)	107 / 677 (15.81%)
	occurrences (all)	87	107

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Nil
