General information about the trial

Main objective of the trial:

Primary objective will be to assess the clinical benefit rate (defined as 6-month progression free rate) with T in patients with locally relapsed/metastatic uterine leiomyosarcoma pretreated with anthracycline ± ifosfamide and/or gemcitabine ± docetaxel. For the subgroup population pretreated only with anthracycline ± ifosfamide the patients enrolled in the arm B will serve as a parallel internal control.

Subject disposition

Recruitment

Recruitment details:

To be eligible for the trial patients must have received at least one line of chemotherapy either in adjuvant setting or as first line chemotherapy in advanced/recurrent disease. Patients who have not already received gemcitabine ± docetaxel will be randomized to receive trabectedin (arm A) or gemcitabine+docetaxel (arm B).

Pre-assignment

Screening details:

NA

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Trabectedin (Arm A randomized)

Arm description:

Trabectedin treatment can be continued until progressive disease, major toxicity, patient's intolerance or unwillingness to continue treatment or medical decision by the responsible physician.

Arm type	Experimental
Investigational medicinal product name	Trabectedin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

Trabectedin is manufactured by PharmaMar as a lyophilized powder in glass vials containing 0.25 or 1 mg of the drug. It has to be reconstituted in 5 ml or 20 ml of sterile water for injection and further diluted in sodium chloride solution 0.9% for a total volume of 500 ml and administered at the dose of 1.3 mg/sqm as a 24-hour continuous infusion via a central venous access. All patients must have an indwelling central catheter at the time of starting trabectedin.

Arm title	Gemcitabine+Docetaxel (Arm B)
------------------	-------------------------------

Arm description:

Gemcitabine+docetaxel treatment is planned for six cycles, unless there is evidence of disease progression, unacceptable toxicity or patient's intolerance or unwillingness to continue treatment, or medical decision by the responsible physician. Patients with continued response after six cycles can receive two additional cycles of combination therapy or continue with Gemcitabine alone.

Arm type	Active comparator
Investigational medicinal product name	Gemcitabine+Docetaxel
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

Patients will receive gemcitabine 900 mg/m² on days 1 and 8 intravenously over 90 min, followed by docetaxel 75 mg/m² on day 8 intravenously over 1 h.

Arm title	Trabectedin (Arm A)
