

Clinical trial results:

A Prospective Single Arm, Open-label, International, Multicenter Study to Evaluate the Safety, Efficacy and Pharmacokinetics of Atazanavir (ATV) Powder Boosted with Ritonavir (RTV) Liquid with an Optimized NRTI Background Therapy, in HIV Infected Pediatric Patients Greater Than or Equal to 3 Months to Less Than 6 Years. (Pediatric Atazanavir International Clinical Evaluation: the PRINCE I study)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000804-PIP01-09
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 September 2017
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	11 September 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of Study AI424397 was to describe the safety of ATV powder formulation boosted with RTV liquid-based highly active antiretroviral therapy regimens in pediatric subjects dosed through 48 weeks (or a minimum of 24 weeks for subjects who were 5.5 years of age at the time of study start)

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Conference on Harmonization Good Clinical Practice Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 November 2010
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Brazil: 1
Country: Number of subjects enrolled	Chile: 7
Country: Number of subjects enrolled	Mexico: 13
Country: Number of subjects enrolled	Peru: 3
Country: Number of subjects enrolled	South Africa: 56
Country: Number of subjects enrolled	Thailand: 2
Worldwide total number of subjects	82
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	41
Children (2-11 years)	41
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 82 pediatric subjects were enrolled, and 56 received treatment. Reasons for not receiving treatment treated were: no longer met study criteria (23 subjects), other reason (2 subjects), and withdrew consent (1 subjects).

Period 1

Period 1 title	Stage 1 (ATV powder formulation)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Atazanavir powder, 150 mg/Ritonavir oral solution, 80 mg

Arm description:

Subjects weighing 5 to <10 kg received atazanavir (ATV), 150-mg powder dosed in 50-mg sachet packets, and ritonavir (RTV) oral solution, 80 mg. Stage 1: Initial dose was determined by subject's weight on the day of the first on-treatment study visit (Day 1). ATV dispersible powder was mixed with a small amount of food or beverage (water, milk, chocolate milk, liquid infant formula, applesauce, or yogurt). If water was used, mixture must have been taken with food. The entire contents of the mixture must have been consumed to obtain the full dose. The ritonavir oral solution was taken immediately before or after the ATV powder preparation. Stage 2: Subjects who reached the age of 6 years or a weight of 25 kg were transitioned to the capsule formulation of ATV. Those who weighed 15 to <20 kg received ATV, 150 mg, with RTV, 100 mg; those who weighed 20 to <40 mg received ATV, 200, with RTV, 100 mg; and those who weighed at least 40 mg received ATV, 300 mg, with RTV, 100 mg.

Arm type	Experimental
Investigational medicinal product name	Atazanavir
Investigational medicinal product code	
Other name	Reyataz BMS-232632
Pharmaceutical forms	Powder for oral solution
Routes of administration	Oral use

Dosage and administration details:

Powder, oral, dosed by weight. Subjects who weighed 5 to <10 kg received atazanavir (ATV), 150 mg, and ritonavir (RTV), 80 mg once per day for 48 weeks or until pediatric indication is locally approved and subject meets requirements to receive appropriate formulation

Investigational medicinal product name	Ritonavir
Investigational medicinal product code	
Other name	Norvir
Pharmaceutical forms	Powder for oral solution
Routes of administration	Oral use

Dosage and administration details:

Oral solution, 80 mg/mL, once per day for 48 weeks or until pediatric indication is locally approved and subject meets requirements to receive appropriate formulation

Arm title	Atazanavir powder, 200 mg/Ritonavir oral solution, 80 mg
------------------	--

Arm description:

Subjects weighing 10 to <15 kg received ATV powder, 200 mg, dosed in 50-mg sachet packets and RTV oral solution, 80 mg. Stage 1: Initial dose was determined by the subject's weight on the day of the first on-treatment study visit (Day 1). ATV dispersible powder was mixed with a small amount of food or beverage (water, milk, chocolate milk, liquid infant formula, applesauce, or yogurt). If water was used, mixture must have been taken with food. All of the mixture must have been consumed to obtain the full dose. The RTV oral solution was taken immediately before or after the ATV powder preparation. Stage

2: Subjects who reached the age of 6 years or a weight 25 kg were transitioned to the capsule formulation of ATV. Those who weighed 15 to <20 kg received ATV, 150 mg, with RTV, 100 mg; those who weighed 20 to <40 mg received ATV, 200, with RTV, 100 mg; and those who weighed at least 40 mg received ATV, 300 mg, with RTV, 100 mg.

Arm type	Experimental
Investigational medicinal product name	Ritonavir
Investigational medicinal product code	
Other name	Norvir
Pharmaceutical forms	Powder for oral solution
Routes of administration	Oral use

Dosage and administration details:

Oral solution, 80 mg/mL, once per day for 48 weeks or until pediatric indication is locally approved and subject meets requirements to receive appropriate formulation

Investigational medicinal product name	Atazanavir
Investigational medicinal product code	
Other name	Reyataz BMS-232632
Pharmaceutical forms	Powder for oral solution
Routes of administration	Oral use

Dosage and administration details:

Powder, oral, dosed by weight. Subjects who weighed 5 to <10 kg received atazanavir (ATV), 150 mg, and ritonavir (RTV), 80 mg; those who weighed 10 to <15 kg received ATV, 200 mg, and RTV, 80 mg; and those who weighed 15 to <25 kg received ATV, 250 mg, and RTV, 80 mg, once per day for 48 weeks or until pediatric indication is locally approved and subject meets requirements to receive appropriate formulation

Arm title	Atazanavir powder, 250 mg/Ritonavir oral solution, 80 mg
------------------	--

Arm description:

Subjects weighing 15 to <25 kg received 250 mg of ATV powder dosed in 50-mg sachet packets, with 80 mg of RTV solution. Stage 1: Initial dose was determined by the subject's weight on the day of the first on-treatment study visit (Day 1). ATV dispersible powder was mixed with a small amount of food or beverage (water, milk, chocolate milk, liquid infant formula, applesauce, or yogurt). If water was used, mixture must have been taken with food. The entire contents of the mixture must have been consumed to obtain the full dose. The ritonavir oral solution was taken immediately before or after the ATV powder preparation. Stage 2: Subjects who reached the age of 6 years or a weight 25 kg were transitioned to the capsule formulation of ATV. Those who weighed 15 to <20 kg received ATV, 150 mg, with RTV, 100 mg; those who weighed 20 to <40 mg received ATV, 200, with RTV, 100 mg; and those who weighed at least 40 mg received ATV, 300 mg, with RTV, 100 mg.

Arm type	Experimental
Investigational medicinal product name	Ritonavir
Investigational medicinal product code	
Other name	Norvir
Pharmaceutical forms	Powder for oral solution
Routes of administration	Oral use

Dosage and administration details:

Oral solution, 80 mg/mL, once per day for 48 weeks or until pediatric indication is locally approved and subject meets requirements to receive appropriate formulation

Stage 1: Initial dose was determined by the subject's weight on the day of the first on-treatment study visit (Day 1). ATV dispersible powder was mixed with a small amount of food or beverage (water, milk, chocolate milk, liquid infant formula, applesauce, or yogurt). If water was used, mixture must have been taken with food. The entire contents of the mixture must have been consumed to obtain the full dose. The ritonavir oral solution was taken immediately before or after the ATV powder preparation. Stage 2: Subjects who reached the age of 6 years or a weight 25 kg were transitioned to the capsule formulation of ATV. Those who weighed 15 to <20 kg received ATV, 150 mg, with RTV, 100 mg; those who weighed 20 to <40 mg received ATV, 200, with RTV, 100 mg; and those who weighed at least 40 mg received ATV, 300 mg, with RTV, 100 mg.

Reporting group title	Atazanavir powder, 150 mg/Ritonavir oral solution, 80 mg
-----------------------	--

Reporting group description:

Subjects weighing 5 to <10 kg received atazanavir (ATV), 150-mg powder dosed in 50-mg sachet packets, and ritonavir (RTV) oral solution, 80 mg. Stage 1: Initial dose was determined by subject's weight on the day of the first on-treatment study visit (Day 1). ATV dispersible powder was mixed with a small amount of food or beverage (water, milk, chocolate milk, liquid infant formula, applesauce, or yogurt). If water was used, mixture must have been taken with food. The entire contents of the mixture must have been consumed to obtain the full dose. The ritonavir oral solution was taken immediately before or after the ATV powder preparation. End point type	Secondary
End point timeframe: At Week 2	

End point values	Atazanavir powder, 150 mg/Ritonavir oral solution, 80 mg	Atazanavir powder, 200 mg/Ritonavir oral solution, 80 mg	Atazanavir powder, 250 mg/Ritonavir oral solution, 80 mg	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	20	18	15	
Units: L/h per kilogram				
geometric mean (full range (min-max))				
CLT/F per kilogram Atazanavir	0.65 (0.2 to 1.8)	0.32 (0.1 to 2.6)	0.24 (0.1 to 0.5)	
CLT/F per kilogram Ritonavir (n=19, 18, 15)	0.65 (0.2 to 7.5)	0.32 (0.04 to 5.9)	0.35 (0.1 to 1.4)	

Statistical analyses

No statistical analyses for this end point

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Events were reported from start of treatment up to 30 days following discontinuation of treatment (ATV powder or capsule, through Stages 1 and 2 combined).

Assessment type	Systematic

Reporting groups

Reporting group title	Body Weight 5 Kilogram (kg) to less than 10 kg
-----------------------	--

Reporting group description:

Subjects received 150 milligram (mg) Atazanvir (ATV) as powder (Initially contained 10 percent (%) aspartame, after protocol amendment quantity of aspartame reduced to 4.2%) and 100 mg Ritonavir (RTV) as oral solution once a day in combination of an optimized nucleoside backbone therapy. When participant reached to 6 years of age or had a body weight at least 25 Kilogram (kg) they transitioned to the capsule formulations of ATV and RTV.

Reporting group title	Body Weight 10 kg to less than 15 kg
-----------------------	--------------------------------------

Reporting group description:

Subjects received 200 mg ATV as powder (Initially contained 10% aspartame, after protocol amendment quantity of aspartame reduced to 4.2%) with 80 mg RTV as oral solution once a day in combination of an optimized nucleoside backbone therapy. When participant reached to 6 years of age or had a body weight at least 25 kg they transitioned to the capsule formulations of ATV and RTV.

Reporting group title	Body Weight 15 kg to less than 25 kg
-----------------------	--------------------------------------

Reporting group description:

Subjects received 250 mg ATV as powder (Initially contained 10% aspartame, after protocol amendment quantity of aspartame reduced to 4.2%) with 80 mg RTV as oral solution once a day in combination of an optimized nucleoside backbone therapy. When participant reached to 6 years of age or had a body weight at least 25 kg they transitioned to the capsule formulations of ATV.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
08 July 2010	The primary purpose of this amendment is as follows: 1) To clarify subjects' age range at time of first treatment, which will be 3 months to 5 years and 6 months of age. This change is to allow subjects who are nearly 6 years of age to have a minimum of 24 weeks of treatment with the powder formulation. 2) Additional visits are included in Stage 2 of the study. Subjects who switch to the capsule formulation will have 2 additional visits after the day of the switch. The new visits will be added at Weeks 4 and 8 following Day 0 of Stage 2 (day of switch to capsule). There will be a visit at Week 12 and every 12 weeks thereafter (ie, every 3 months). A transition period of 8 weeks is allowed to enable subjects to switch from the powder to the capsule. Subjects who are not able to swallow the capsule by the Stage 2 Week 8 week visit will be discontinued from the study. 3) Supplementary trough PK (ATV/RTV only) testing will be added as part of the clinical evaluation of a subject, for whom an investigator has a clinical concern (eg: a subject who has virologic rebound or is failing to suppress at a rate expected by the investigator).
18 April 2011	The purpose of this amendment is to clarify the intent to allow the use of both brand and generic locally approved and available NRTIs by removing statements not intended to have been in the protocol.
24 October 2011	1) To allow switch of NRTIs during the study in case of confirmed viral rebound ≥ 400 copies virologic rebound ≥ 400 copies/mL and $< 10,000$ copies/mL associated with a genotypic and / or phenotypic resistance to one or more assigned NRTI study drugs without genotypic and/or phenotypic resistance (including reduced sensitivity) to ATV or due to treatment-limiting NRTI toxicity 2) To add section on identification and reporting of events occurring in study participants which meet protocol-defined criteria of Drug Induced Liver Injury (DILI). 3) To allow RTV tablets in stage 2 of the study 4) To define treatment experienced subjects in Section 1.1 and Section 3.3.1. 5) To clarify the definition and management of virologic rebound and failure (Section 4.5.2) and discontinuation of subjects from treatment (Section 3.5). 6) To clarify that the age limit should be achieved at the time of first treatment. 7) Table 4.1 Product description: Added ritonavir tablet product information and updated the RTV oral solution storage conditions.
27 April 2012	1) To change the whole treatment regimen, including ATV, in patients with confirmed virologic failure or virologic rebound above 1000 copies/mL based on the resistance profile at failure in accordance with the recommendations from guidelines as per FDA comments on amendment 05 in Section 1.1. 2) Table 3.1.1B: Removed table note b as it is inconsistent with other protocol sections. Clarified in table title that ritonavir tablets or capsules should be used for pediatric patients (8 to less than 18 years of age). 3) To modify the definition of virologic failure in accordance with the updated 2011 DHHS pediatric guidelines in section 4.5.2 and clarify the virologic failure criteria to discontinue a subject in the study in Sections 3.5 and 4.5.2. 4) Table 4.1. Product description: Updated the ATV capsules storage conditions (excursions permitted 15-30°C) to be aligned with the

29 January 2013	<p>1) To switch all subjects in Stage 2, who are still on the current atazanavir oral powder formulation (10% aspartame), to the new 4.2% aspartame atazanavir oral powder formulation and to collect palatability/acceptability data at the time of switch and after the switch in Sections 3.1.1 and 4.1.</p> <p>2) Added background information on ATV 4.2% aspartame powder formulation in Section 1.4.</p> <p>3) Added that subject diaries should be used for subjects switching to the new 4.2% aspartame ATV powder formulation in stage 2 and as long as the subject is on the new ATV powder or maximum duration of one year, whichever comes first in Section 4.5.</p> <p>4) Added Adherence/Tolerability assessment procedures and added note that the assessments only apply to subjects remaining on ATV powder in Stage 2 in Time and Event Table 5.1C.</p> <p>5) Throughout the protocol, the numbering and lay-out of Tables and Figures is changed and hyperlinks are inserted.</p> <p>6) Cover page: BMS Research & Development Belgium address has been changed</p>
15 April 2014	<p>1) To increase the blood volume collection from 1 up to 2 mL for HIV RNA testing in Stage 2 when switching to the new Abbott RealTime HIV-1 assay after the Roche Amplicor assay is discontinued.</p> <p>2) To address inconsistencies and administrative changes in Appendices 1 and 4.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
