Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 July 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	07 July 2014
Global end of trial reached?	Yes
Global end of trial date	07 July 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The aim of this study was to determine whether the sequential application of povidone iodine-alcohol (PVI) followed by chlorhexidine gluconate-alcohol (CHG) would reduce surgical wound contamination to a greater extent than PVI applied twice in patients undergoing spinal surgery.

Protection of trial subjects:

The following exclusion criteria were applied:

Patients who had more than 7 days in hospital prior to surgery.

Patients who had been transferred from another hospital, i.e. patients who had been inpatients in another hospital and transferred for surgery.

Patients with overt spinal infections suspected pre-operatively, or where evidence of purulence in any part of the wound is observed during surgery.

Patients who were sensitive or allergic to the skin antiseptics.

Patients on antibiotics prior to surgery as antibiotics can be excreted in sweat and could therefore affect the normal resident microbiota.

Patients aged less than 18 years.

Pregnant women.

A data monitoring committee was also convened for the trial.

As the intervention being investigated was part of a routine surgical procedure no other protections were required.

Background therapy:

Not applicable.

Evidence for comparator: -

Actual start date of recruitment	23 May 2010
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 407
Worldwide total number of subjects	407
EEA total number of subjects	407

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	350
From 65 to 84 years	56
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

Patients admitted for spinal surgery (Belfast Trust) were invited to participate in the study at pre-op assessment (4 to 6 months prior to their operation). Following admission 408 patients were recruited to the trial between 23/05/2010 and 07/07/2014.

Pre-assignment

Screening details:

All patients undergoing elective spinal surgery were screened and invited to participate in the study at a preoperative visit or by letter. 557 patients were approached and screened in accordance with the trial inclusion/exclusion criteria. 149 patients were deemed ineligible and were not recruited.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Single blind ^[1]
Roles blinded	Investigator, Data analyst ^[2]

Blinding implementation details:

The randomisation schedule was generated before the start of the trial by a statistician not involved in the trial or assessing outcomes. The trial was open label to the patients and hospital staff as the antiseptics were different colours and formulations. The principal investigator and staff who analysed and recorded bacterial culture from samples were however blinded to the treatment group.

Arms

Are arms mutually exclusive?	Yes
Arm title	Arm 1

Arm description:

Patient skin disinfected before surgery using PVI (10% [w/w (1% w/w available iodine)] in 95% industrial denatured alcohol, povidone iodine; Videne Alcoholic Tincture) twice.

Arm type	Active comparator
Investigational medicinal product name	PVI (povidone iodine; Videne Alcoholic Tincture)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cutaneous solution, Cutaneous solution + medicated sponge
Routes of administration	Cutaneous use

Dosage and administration details:

10% [w/w (1% w/w available iodine)] in 95% industrial denatured alcohol, applied neat, twice to skin surface before surgery.

Arm title	Arm 2
------------------	-------

Arm description:

Patient skin was disinfected before surgery using PVI (10% [w/w (1% w/w available iodine)] in 95% industrial denatured alcohol, povidone iodine; Videne Alcoholic Tincture) once followed by CHG (2% [w/v] chlorhexidine gluconate in 70% [v/v] isopropyl alcohol; Chloraprep with tint).

Arm type	Experimental
Investigational medicinal product name	PVI (povidone iodine; Videne Alcoholic Tincture) CHG (chlorhexidine gluconate; Chloraprep with tint)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cutaneous solution, Cutaneous solution + medicated sponge
Routes of administration	Cutaneous use

Dosage and administration details:

10% [w/w (1% w/w available iodine)] in 95% industrial denatured alcohol, applied once neat to skin surface followed by 2% [w/v] chlorhexidine gluconate in 70% [v/v] isopropyl alcohol, applied once neat to skin surface before surgery.

Notes:

[1] - The number of roles blinded appears inconsistent with a single blinded trial. It is expected that there will be one role blinded in a single blind trial.

Justification: The trial was open label to the patients and hospital staff as the antiseptics were different colours and formulations. The principal investigator and staff who analysed and recorded bacterial culture from samples were however blinded to the treatment group.

[2] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: The trial was open label to the patients and hospital staff as the antiseptics were different colours and formulations. The principal investigator and staff who analysed and recorded bacterial culture from samples were however blinded to the treatment group.

Reporting group description: -	
--------------------------------	--

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: There was one serious adverse event reported for the study and no non-serious adverse events reported.

Serious adverse events	Arm 2 PVI + CHG		
Total subjects affected by serious adverse events			
subjects affected / exposed	1 / 1 (100.00%)		
number of deaths (all causes)	0		
number of deaths resulting from adverse events	0		
Nervous system disorders			
Nerve injury	Additional description: The SAE reported a nerve injury which is a recognised risk of all lumbar spine surgery and was not related to the study drug.		
subjects affected / exposed	1 / 1 (100.00%)		
occurrences causally related to treatment / all	0 / 1		
deaths causally related to treatment / all	0 / 0		

Frequency threshold for reporting non-serious adverse events: 0 %

Non-serious adverse events	Arm 2 PVI + CHG		
Total subjects affected by non-serious adverse events			
subjects affected / exposed	0 / 1 (0.00%)		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
08 January 2010	Protocol version 1.2: Protocol amendment
28 January 2010	Protocol version 1.3:Amendment to letter of invitation to participant
23 May 2011	Protocol version 1.5: Change to exclusion criteria in protocol: Number of days in hospital prior to surgery increased from no more than 2 to no more than 7 to increase recruitment rate.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
