

## Clinical trial results:

**A phase II multicentric study in adults with acute myelogenous leukaemia (AML) in first complete remission (CR1) using IV BuCy2 in a once daily Bu regimen targeting a narrow therapeutic window prior to hematopoietic stem cell transplantation.**

### Summary

EudraCT number	2009-016601-42
Trial protocol	FR ES IT
Global end of trial date	19 June 2014

### Results information

Result version number	v1 (current)
This version publication date	09 March 2017
First version publication date	09 March 2017

### Trial information

#### Trial identification

Sponsor protocol code	F60002 IN 202 G0
-----------------------	------------------

#### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	-
WHO universal trial number (UTN)	-

### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

---

**Results analysis stage**

Analysis stage	Final
Date of interim/final analysis	30 September 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	19 June 2014
Was the trial ended prematurely?	No

Notes:

---

**General information about the trial**

Main objective of the trial:

To target the upper range of the busulfan therapeutic window (AUC from 4400 to 6000  $\mu\text{M}\cdot\text{min}$ ) from a once daily myeloablative regimen in adult patients with AML in CR1 receiving the IV BuCy2 regimen.

Protection of trial subjects:

Before enrolment in the study trial, the patient was examined by an experienced physician in charge of the study; some routine tests, including usual blood tests for pre-transplant check-up, a chest X-ray, echocardiogram and pulmonary tests function were carried out in order to assess vital functions and monitor the disease. Results of these tests were documented by the physician and the specialized team in charge of performing the hematopoietic stem cell transplantation. The patient was hospitalized 8 days before the transplantation in a bone marrow unit. The entire procedure of transplantation including administration of the conditioning regimen was supervised by a specialized physician. The patient was isolated in a sterile environment. The conditioning regimen consisted of intravenous busulfan over 4 days followed by a day of rest and followed by infusion of cyclophosphamide over 2 days (60 mg/kg/d); there was a day of rest after the last day of cyclophosphamide, then on the following day (Day0) the graft was infused to the patient. During the administration of the conditioning therapy, the dose level of intravenous busulfan were adjusted as it was an objective of the trial . Twelve plasma samples were collected over 4 days. The duration of the initial hospitalization lasted between four and six weeks until complete recovery. The follow-up, the treatments, the transplantation procedure were performed by the physician in charge of the study. He was also responsible of reviewing the patient information sheet and obtaining the patient's agreement. Women of childbearing potential had to have negative serum or urine pregnancy test within 72 hours prior to the start of study treatment. Fertile men and women of childbearing potential were expected to use an effective method of contraception during the 2 months preceding the start of study treatment, during treatment and at least 6 months following the last dose of study treatment.

Background therapy:

Allogeneic Hematopoietic Stem Cell transplantation (HSCT) is a curative therapy and is widely used in the treatment of various haematological and non-haematological malignancies. The conditioning therapy is a key point in this procedure. Apart from the conditioning regimen, during the allogeneic procedure, many concomitant treatments are usually administered before or after infusion of the graft as prophylaxis to prevent occurrence of side effects or as part of supportive care. The graft was administered after the end of the conditioning therapy. Oral phenytoin was used as seizure prophylaxis. The prophylaxis to prevent the occurrence of veno-occlusive disease was based on heparin. The prophylaxis for prevention of the graft-versus-host-disease could have combined antithymoglobuline (if indicated) and ciclosporin and methotrexate. The recommended doses and duration of the graft-versus-host-disease prophylaxis was to be adapted based on local institutional guidelines. Hydration with glucose serum or chloride serum, uromitexan and anti-emetic therapies were recommended and adjusted according to the local institutional guidelines. Others medications such as blood transfusions, platelet transfusions, growth factor, antibiotics, antifungal treatment were given according to institutional guidelines.

Evidence for comparator:

not applicable. The study was a phase multicentric study, open-label

Actual start date of recruitment	17 May 2010
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	2 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 2
Country: Number of subjects enrolled	France: 22
Country: Number of subjects enrolled	Italy: 6
Worldwide total number of subjects	30
EEA total number of subjects	30

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	30
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

30 patients were enrolled from 8 active centers in 3 countries. The patient's eligibility was assessed by an experienced physician within four weeks before the start of conditioning regimen. First patient enrolled on the 17th May 2010; last patient enrolled on the 21th May 2012.

### Pre-assignment

Screening details:

Patient eligibility was assessed from Day-36 to Day-9 (the period before the day of transplantation was counted as negative). Patient's informed consent was signed. Parameters: demographics, disease, organ functions, laboratory tests, eligibility for transplantation, compatible donor, no exclusion criteria.

Assignment of patient number.

### Pre-assignment period milestones

Number of subjects started	30
Intermediate milestone: Number of subjects	pre study screening period: 30
Number of subjects completed	30

### Period 1

Period 1 title	study treatment period-follow-up periods (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

not applicable

### Arms

Arm title	overall cohort-study treatment period and follow-up periods
-----------	---

Arm description:

The study was split in study treatment period and study follow-up periods. The reference day was Day0 the day of transplantation. After Day0 the number of days was counted as positive. Before Day0, the days was counted as negative. The study treatment period started from Day-8 up to Day+28: 30 patients (overall cohort) were enrolled and treated with IV BuCy2 as conditioning regimen prior to allogeneic hematopoietic stem cell transplantation. During this period, in-patients evaluations for safety and efficacy were done until Day+28. Follow-up period 1 : Day+29 up to Day+100; Follow-up period 2: Day+101 up to Day+365; Follow-up period 3: Day+366 up to Day+730. During the 3 study follow-up periods, the patients could have received additional therapies as part of the transplantation procedure, and the clinical evaluations with safety and efficacy parameters were collected. All 30 patients were evaluable for pharmacokinetic, safety and efficacy analysis.

Arm type	Investigational arm
Investigational medicinal product name	Busilvex
Investigational medicinal product code	F60002
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

First administered dose (Day-8) was 3.2 mg/kg according to either actual body weight (ABW) for normal patients or to adjusted ideal body weight (AIBW) for obese patients. Then subsequent doses (Day-7 to Day-5) were adjusted according to the targeted AUC (i.e.: 5200 µM.min), corresponding to the middle of the therapeutic window (i.e.: 4400-6000 µM.min) and based on prior PK information collected from the dose before. One-day rest (Day-4) followed the last administration of IV Bu before cyclophosphamide treatment.

Investigational medicinal product name	Cyclophosphamide
Investigational medicinal product code	cyclophosphamide
Other name	Cytosan; Endoxan
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

One-day rest (Day-4) followed the last administration of IV Bu before cyclophosphamide administered at a dose of 60 mg/kg over two to four hours for two consecutive days (total dose 120 mg/kg) (Day-3 to Day-2). One-day rest (Day-1) followed the IV BuCy2 regimen before Stem Cell Infusion on Day0.

<b>Number of subjects in period 1</b>	overall cohort-study treatment period and follow-up periods

## End points

### End points reporting groups

Reporting group title	overall cohort-study treatment period and follow-up periods
-----------------------	---

Reporting group description:

The study was split in study treatment period and study follow-up periods. The reference day was Day0 the day of transplantation. After Day0 the number of days was counted as positive. Before Day0, the days was counted as negative. The study treatment period started from Day-8 up to Day+28: 30 patients (overall cohort) were enrolled and treated with IV BuCy2 as conditioning regimen prior to allogeneic hematopoietic stem cell transplantation. During this period, in-patients evaluations for safety and efficacy were done until Day+28. Follow-up period 1 : Day+29 up to Day+100; Follow-up period 2: Day+101 up to Day+365; Follow-up period 3: Day+366 up to Day+730. During the 3 study follow-up periods, the patients could have received additional therapies as part of the transplantation procedure, and the clinical evaluations with safety and efficacy parameters were collected. All 30 patients were evaluable for pharmacokinetic, safety and efficacy analysis.

### Primary: Number of patients in Bu therapeutic window

End point title	Number of patients in Bu therapeutic window <sup>[1]</sup>
-----------------	--

End point description:

To target the upper range of the busulfan therapeutic window (AUC from 4400 to 6000  $\mu\text{M}\cdot\text{min}$ ) from a once daily myeloablative regimen in adult patients with AML inCR1 receiving the IV BuCy2 regimen. A daily PK guided dose adjustment from Day-7 (Dose 2) to Day-5 (Dose 4) of Bu treatment was expected to enable the same targeting performance ( $\geq 70$  to 80% of patients within the therapeutic window) as that achieved for the larger therapeutic window (i.e.: 3600 – 6000  $\mu\text{M}\cdot\text{min}$ ) without dose adjustment. The endpoint value was expressed by the number of subjects within the Bu therapeutic window (AUC from 4400 to 6000  $\mu\text{M}\cdot\text{min}$ ).

End point type	Primary
----------------	---------

End point timeframe:

Blood sampling for pharmacokinetic analysis performed over 4 days from Day-8 (dose 1) to Day-5 (dose 4) in order to calculate daily busulfan plasma exposure (AUC). Doses were adjusted from Day-7 (dose 2) to Day-5 (dose 4).

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The endpoint number of patients in Bu therapeutic window was calculated and reported as absolute count. No statistical test was performed for this endpoint

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
14 February 2011	The end of the period of inclusion was extended to Q2 2012.
21 June 2011	The amendment modified the planned list of centers and investigators with addition of new center as the accrual was slow. The procedure of IV Bu administration was modified to allow more flexibility to each participating center.
18 November 2011	Update of the manufacturer site for Busilvex. There was no consequence for the certification of the finished product. The corresponding section in the protocol was updated.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

not applicable

Notes:
