Analysis stage	Interim
Date of interim/final analysis	12 May 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	12 May 2014
Global end of trial reached?	No

Notes:

General information about the trial

Main objective of the trial:

The primary efficacy endpoint was to compare the Progression Free Survival (PFS) as assessed by the independent review panel according to Response Evaluation Criteria for Solid Tumors (RECIST) 1.1 between the treatment groups (sorafenib in combination of capecitabine versus placebo in combination of capecitabine).

Protection of trial subjects:

The conduct of this clinical study met all local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice. Before entering the study, the informed consent form was read by and explained to all subjects. Participating subjects signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Background therapy:

Capecitabine was administered orally at a dose of 1,000 milligram per square meter (mg/m²) twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Capecitabine dose was escalated to 1,250 mg/m² twice daily if fatigue, dermatologic toxicities, and/or gastrointestinal toxicities in a prior cycle in which the subject received sorafenib at a total daily dose of 800 mg/4 tablets (400 mg/2 tablets, twice daily) were Grade 1 or less as per the common terminology criteria for adverse events version 4.0 (CTCAE v4.0).

Evidence for comparator: -

Actual start date of recruitment	21 February 2011
Long term follow-up planned	Yes
Long term follow-up rationale	Efficacy
Long term follow-up duration	39 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	447
From 65 to 84 years	90
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

At 154 sites in 22 countries, subjects with histologically or cytologically confirmed human epidermal growth factor receptor 2 (HER2)-negative adenocarcinoma of the breast, and locally advanced or metastatic disease, were screened.

Pre-assignment

Screening details:

Of 707 subjects screened, 537 subjects were randomized and 527 subjects received at least 1 dose of study treatment. The reasons for 170 screen failures were adverse event in 21 subjects, disease progression, recurrence or relapse in 2, consent withdrawn in 16, death in 4, and protocol violation in 127 subjects.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Carer, Assessor, Subject

Blinding implementation details:

In compliance with applicable regulations, in the event of a suspected unexpected serious adverse reaction (SUSARs) that was considered to be related to the blinded treatment, the subject's treatment code was usually unblinded before reporting to the health authorities, ethic committees, and investigators. Unblinding occurred for emergency purposes only.

Arms

Are arms mutually exclusive?	Yes
Arm title	Sorafenib (Nexavar, BAY43-9006) + Capecitabine

Arm description:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Sorafenib was administered orally at a dose of 600 mg (200 mg in the morning, 400 mg in the evening) daily, continuously (that is, Days 1 to 21, inclusive). A treatment cycle consisted of 21 days. If tolerability criteria were met for a subject, capecitabine dose was escalated to 1,250 mg/m² twice daily and sorafenib dose to a total daily dose of 800 mg for that subject.

Arm type	Experimental
Investigational medicinal product name	Capecitabine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Capecitabine dose was escalated to 1,250 mg/m² twice daily if fatigue, dermatologic toxicities, and/or gastrointestinal toxicities in a prior cycle in which the subject received sorafenib at a dose of 800 mg (400 mg twice daily) were Grade 1 or less as per the CTCAE v4.0.

Investigational medicinal product name	Sorafenib
Investigational medicinal product code	BAY43-9006
Other name	Nexavar
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Sorafenib was administered orally at a dose of 600 mg (200 mg in the morning, 400 mg in the evening) daily, continuously (that is, Days 1 to 21, inclusive). Sorafenib dose was escalated to 800 mg (400 mg twice daily) in Cycle 2 or beyond if fatigue, dermatologic toxicities, and/or gastrointestinal toxicities in a

prior cycle in which the subject received sorafenib at a total daily dose of 600 mg were Grade 1 or less as per CTCAE v4.0.

Arm title	Placebo + Capecitabine
------------------	------------------------

Arm description:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Placebo matching to sorafenib was administered orally, 3 tablets (1 tablet in the morning, 2 tablets in the evening) daily, continuously (that is, Days 1 to 21, inclusive). A treatment cycle consisted of 21 days. If tolerability criteria were met for a subject, capecitabine dose was escalated to 1,250 mg/m² twice daily and placebo dose to a total daily dose of 4 tablets (2 tablets twice daily) for that subject.

Arm type	Placebo
Investigational medicinal product name	Capecitabine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Capecitabine dose was escalated to 1,250 mg/m² twice daily if fatigue, dermatologic toxicities, and/or gastrointestinal toxicities in a prior cycle in which the subject received placebo at a dose of 4 tablets (2 tablets twice daily) were Grade 1 or less as per the CTCAE v4.0.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo matching to sorafenib was administered orally, 3 tablets (1 tablet in the morning, 2 tablets in the evening) daily, continuously (that is, Days 1 to 21, inclusive). Placebo dose was escalated to 4 tablets (2 tablets twice daily) in Cycle 2 or beyond if fatigue, dermatologic toxicities, and/or gastrointestinal toxicities in a prior cycle in which the subject received placebo at a total daily dose of 3 tablets were Grade 1 or less as per CTCAE v4.0.

Subject analysis set title	Full analysis set (FAS)
----------------------------	-------------------------

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

FAS (also considered the Intent-to-treat (ITT) analysis set) population (N=537) was defined as all randomized subjects. Subjects were analyzed as randomized, that is, even if a subject was randomized and received no drug or if randomized and initially received incorrect drug prior to switching to correct study drug, these subjects were still analyzed for efficacy under FAS, as randomized.

Subject analysis set title	Pharmacokinetic analysis set (PKS)
----------------------------	------------------------------------

Subject analysis set type	Sub-group analysis
---------------------------	--------------------

Subject analysis set description:

PKS (N=182) included all subjects with a valid pharmacokinetic profile of capecitabine.

Subject analysis set title	Safety analysis set (SAF)
----------------------------	---------------------------

Subject analysis set type	Safety analysis
---------------------------	-----------------

Subject analysis set description:

SAF (N=527) was comprised of all randomized subjects who received at least one dose of study medication (sorafenib, placebo or capecitabine). Subjects were analyzed as treated.

Primary: Progression-free Survival (PFS) Assessed by the Independent Review Panel According to Response Evaluation Criteria for Solid Tumors (RECIST) 1.1

End point title	Progression-free Survival (PFS) Assessed by the Independent Review Panel According to Response Evaluation Criteria for Solid Tumors (RECIST) 1.1
-----------------	--

End point description:

PFS was defined as the time from date of randomization to disease progression, radiological or death due to any cause, whichever occurs first. Subjects without progression or death at the time of analysis were censored at their last date of evaluable tumor evaluation. Median and other 95% CIs computed using Kaplan-Meier estimates.

End point type	Primary
----------------	---------

End point timeframe:

From randomization of the first subject until approximately 3 years or until disease radiological progression

End point values	Sorafenib (Nexavar, BAY43-9006) + Capecitabine	Placebo + Capecitabine		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	266 ^[1]	271 ^[2]		
Units: days				
median (confidence interval 95%)	166 (131 to 206)	165 (126 to 204)		

Notes:

Statistical analyses

Statistical analysis title	PFS by central review panel
-----------------------------------	-----------------------------

Statistical analysis description:

PFS was compared using a stratified log-rank test with a one-sided alpha of 0.005, stratified by region, hormone receptor status, number of previous chemotherapies for metastatic disease. The hazard ratio (sorafenib + capecitabine / placebo + capecitabine) and its 95 percent (%) confidence intervals (CIs) were calculated using the Cox model, stratified by the above factors.

Comparison groups	Sorafenib (Nexavar, BAY43-9006) + Capecitabine v Placebo + Capecitabine
Number of subjects included in analysis	537
Analysis specification	Pre-specified
Analysis type	superiority ^[3]
P-value	= 0.405618 ^[4]
Method	Logrank
Parameter estimate	Hazard ratio (HR)
Point estimate	0.973
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.779
upper limit	1.217

Notes:

[3] - A Hazard ratio of less than (<) 1 indicates superiority of Sorafenib + Capecitabine over Placebo + Capecitabine.

[4] - One-sided p-value from log rank test (stratified per randomization as in interactive voice response system [IVRS]).

Secondary: Overall Survival (OS)

End point title	Overall Survival (OS)
-----------------	-----------------------

End point description:

OS was defined as the time from date of randomization to death due to any cause. Subjects still alive at the time of analysis were censored at their last known alive date. Median and other 95% CIs computed using Kaplan-Meier estimates.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization of the first subject until approximately 3 years later

End point values	Sorafenib (Nexavar, BAY43-9006) + Capecitabine	Placebo + Capecitabine		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	266 ^[5]	271 ^[6]		
Units: days				
median (confidence interval 95%)	575 (467 to 645)	616 (546 to 687)		

Notes:

[5] - FAS

[6] - FAS

Statistical analyses

Statistical analysis title	Statistical analysis for Overall Survival
-----------------------------------	---

Statistical analysis description:

At the time of PFS final analysis, it was OS interim analysis (IA) with 285 total death events. According to protocol specified O'Brien-Fleming type alpha spending function and 285 death events at IA, the pre-specified alpha for this analysis was 0.0075 (one-sided). The hazard ratio (sorafenib + capecitabine / placebo + capecitabine) and its 95% CIs were calculated using the Cox model, stratified by randomization factors.

Comparison groups	Sorafenib (Nexavar, BAY43-9006) + Capecitabine v Placebo + Capecitabine
Number of subjects included in analysis	537
Analysis specification	Pre-specified
Analysis type	superiority ^[7]
P-value	= 0.930088 ^[8]
Method	Logrank
Parameter estimate	Hazard ratio (HR)
Point estimate	1.195
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.943
upper limit	1.513

Notes:

[7] - A Hazard ratio < 1 indicates superiority of Sorafenib+Capecitabine over Placebo+Capecitabine.

[8] - One-sided p-value from log rank test (stratified per randomization as in IVRS). OS was compared using a stratified log-rank test, stratified by region, hormone receptor status, number of previous chemotherapies for metastatic disease.

Secondary: Time to Progression (TTP) by Central Review

End point title	Time to Progression (TTP) by Central Review
-----------------	---

End point description:

TTP was defined as the time from date of randomization to disease radiological progression by central review. Subjects without progression at the time of analysis were censored at their last evaluable tumor assessment date. Median and its 95% CIs were computed using Kaplan-Meier estimates.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization of the first subject until approximately 3 years later or until disease radiological progression

End point values	Sorafenib (Nexavar, BAY43-9006) + Capecitabine	Placebo + Capecitabine		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	266 ^[9]	271 ^[10]		
Units: days				
median (confidence interval 95%)	168 (139 to 215)	165 (127 to 208)		

Notes:

[9] - FAS

[10] - FAS

Statistical analyses

Statistical analysis title	TTP by central review panel
----------------------------	-----------------------------

Statistical analysis description:

TTP was compared using a stratified log-rank test with a one-sided alpha of 0.025, stratified by region, hormone receptor status, number of previous chemotherapies for metastatic disease. The hazard ratio (sorafenib + capecitabine / placebo + capecitabine) and its 95% CIs were calculated using the Cox model, stratified by the above factors.

Comparison groups	Sorafenib (Nexavar, BAY43-9006) + Capecitabine v Placebo + Capecitabine
Number of subjects included in analysis	537
Analysis specification	Pre-specified
Analysis type	superiority ^[11]
P-value	= 0.2105 ^[12]
Method	Logrank
Parameter estimate	Hazard ratio (HR)
Point estimate	0.91
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.723
upper limit	1.146

Notes:

[11] - A Hazard ratio <1 indicates superiority of Sorafenib+Capecitabine over Placebo+Capecitabine.

[12] - One-sided p-value from log rank test (stratified per randomization as in IVRS).

Secondary: Objective Response Rate (ORR) by Central Review

End point title	Objective Response Rate (ORR) by Central Review
-----------------	---

End point description:

ORR was defined as the best tumor response (Complete Response [CR] or Partial Response [PR]) observed during treatment or within 30 days after termination of study treatment, assessed according to the Response Evaluation Criteria in Solid Tumors (RECIST) criteria 1.1. CR and PR needed to be confirmed by another scan at least 4 weeks later.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization of the first subject until approximately 3 years later or until disease radiological progression

End point values	Sorafenib (Nexavar, BAY43-9006) + Capecitabine	Placebo + Capecitabine		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	266 ^[13]	271 ^[14]		
Units: percentage (%) of subjects				
number (confidence interval 95%)	13.5 (9.7 to 18.2)	15.5 (11.4 to 20.4)

[17] - FAS

Statistical analyses

Statistical analysis title	Statistical Analysis for Disease Control Rate
-----------------------------------	---

Statistical analysis description:

DCR and 95% CI based on "general association Cochran-Mantel-Haenszel statistic" with one-sided alpha of 0.025 stratified by number of prior chemotherapies for metastatic disease, hormone receptor status, and region.

Difference = Placebo + Capecitabine - Sorafenib + Capecitabine.

Comparison groups	Placebo + Capecitabine v Sorafenib (Nexavar, BAY43-9006) + Capecitabine
Number of subjects included in analysis	537
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.284674 ^[18]
Method	Cochran-Mantel-Haenszel
Parameter estimate	Percent Difference
Point estimate	-2.34
Confidence interval	
level	95 %
sides	2-sided
lower limit	-10.4
upper limit	5.72

Notes:

[18] - One-sided p-value from Cochran-Mantel-Haenszel test (stratified per randomization as in IVRS).

Secondary: Duration of Response (DOR) by Central Reader

End point title	Duration of Response (DOR) by Central Reader
-----------------	--

End point description:

DOR was defined as the time from date of first response (CR or PR) to the date when Progressive Disease (PD) is first documented, or to the date of death, whichever occurred first according to RECIST version 1.1. Subjects still having CR or PR and have not died at the time of analysis were censored at their last date of tumor evaluation. Duration of response defined for confirmed responders only (that is, CR or PR). '99999' indicates that value could not be estimated due to censored data. Median and 95% CIs were computed using Kaplan-Meier estimates.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization of the first subject until approximately 3 years later or until disease radiological progression

End point values	Sorafenib (Nexavar, BAY43-9006) + Capecitabine	Placebo + Capecitabine

Other pre-specified: Patient Reported Outcomes: Functional Assessment of Cancer Therapy-Breast Symptom Index (8 item) (FBSI-8)

End point title	Patient Reported Outcomes: Functional Assessment of Cancer Therapy-Breast Symptom Index (8 item) (FBSI-8)
-----------------	---

End point description:

The FBSI-8 was an 8-item questionnaire. Subjects responded to each item using a 5-point Likert-type scale ranging from 0 (not at all) to 4 (very much). A total scale score was calculated (range from 0 to 32), with higher scores indicating low symptomatology and reflecting a better Health-Related Quality of Life (HRQoL). The results on the analysis of covariance (ANCOVA) of time-adjusted area under curve (AUC) for the FBSI-8 score were reported. Only subjects with a baseline assessment and at least one post-baseline assessment during the study were used for the AUC-based analyses. Please find the statistical analyses in the attachment below.

Other pre-specified: Patient Reported Outcomes: Euroqol-5 Dimensions (EQ-5D) - Index Score

End point title	Patient Reported Outcomes: Euroqol-5 Dimensions (EQ-5D) - Index Score
-----------------	---

End point description:

The EQ-5D was a generic Quality of life (QoL) preference based instrument and has been validated in the cancer populations. EQ-5D questionnaire contained a 5-item descriptive system of health states (mobility, self-care, usual activities, pain/discomfort, anxiety/depression) and a visual analogue scale (VAS). From the answers to these 5 health states a single HRQoL score ranging from -0.59 to 1 were generated according to the standard scoring algorithm developed by the EuroQoL Group for the instrument. This single score was referred to as the EQ-5D index score. For the EQ-5D, higher scores represented better health status. A change of at least 0.10 to 0.12 points on the EQ-5D index is considered clinically meaningful. The results on ANCOVA of time-adjusted AUC were reported. Only subjects with a baseline assessment and at least one post-baseline assessment during the study were used for the AUC-based analyses.

Reporting groups

Reporting group title	Sorafenib (Nexavar, BAY43-9006) + Capecitabine
-----------------------	--

Reporting group description:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Sorafenib was administered orally at a dose of 600 mg (200 mg in the morning, 400 mg in the evening) daily, continuously (that is, Days 1 to 21, inclusive). A treatment cycle consisted of 21 days. If tolerability criteria were met for a subject, capecitabine dose was escalated to 1,250 mg/m² twice daily and sorafenib dose to a total daily dose of 800 mg for that subject.

Reporting group title	Placebo + Capecitabine
-----------------------	------------------------

Reporting group description:

Capecitabine was administered orally at a dose of 1,000 mg/m² twice daily (12 hours apart) on Days 1 through 14 of each 21-day cycle. Placebo matching with sorafenib was administered orally, 3 tablets (1 tablet in the morning, 2 tablets in the evening) daily, continuously (that is, Days 1 to 21, inclusive). A treatment cycle consisted of 21 days. If tolerability criteria were met for a subject, capecitabine dose was escalated to 1,250 mg/m² twice daily and placebo dose to a total daily dose of 4 tablets (2 tablets twice daily) for that subject.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 December 2010	<ol style="list-style-type: none">1. Several changes were made to the inclusion criterion concerning subjects who were (1) resistant to or failed prior taxane and an anthracycline OR (2) resistant to or failed prior taxane and for whom further anthracycline therapy was not indicated2. Clarification of Consent to Long-Term Follow-up as information on overall survival (a secondary study objective) must be collected for all subjects3. Subjects in the Long-term Follow-up Period should have regular computed tomography (CT) scans/magnetic resonance images (MRIs) until disease progression is documented4. The IVRS used in this study has a built-in 3-day time period for the screening phase5. Participation in the pharmacokinetics part of the study is not mandatory6. To allow collection of pharmacokinetic samples at the scheduled Day 15 visit of appropriate cycles rather than Day 14 to enhance subject convenience by eliminating the need for this additional Day-14 visit7. Anti-cancer drugs or device therapy for the treatment of breast cancer was prohibited within 4 weeks (28 days) or 5 half-lives, whichever was longer, prior to randomization8. Allowed for the use of hematopoietic growth factor (only cycles subsequent to Cycle 1) in study subjects at the discretion of the investigator9. To emphasize that a subject may decline to participate in the optional genetic biomarker study and yet still participate in the study trial.
03 May 2011	<ol style="list-style-type: none">1. Clarifications on inclusion criteria regarding radiological evaluations, dose range of doxorubicin equivalents, eligibility following taxane and anthracycline therapy, discontinuation of prior chemotherapy, and pregnancy test2. Clarifications on exclusion criteria regarding testing of subjects with unknown HER2 status, breast cancer types, subjects with brain metastases, baseline infections, prior radiation, excluded therapies, hemorrhage/bleeding events3. To allow dose re-escalation of sorafenib/placebo only under the specific circumstances that are clearly defined in protocol4. Included detailed guidelines on dose modifications, dose interruptions, and criteria for reintroduction of study medications in response to hematologic toxicities5. To allow subjects for collection of pharmacokinetic samples, to attend their weekly clinic visit scheduled for Cycle 2/Day 15 to be conducted on Cycle 2/Day 146. To state that, if 10 slides are not available, fewer slides may be accepted for formalin-fixed paraffin embedded biopsy after discussion and agreement with the sponsor7. In the interest of increasing the subject safety the protocol was modified to specify that subjects should undergo electrocardiograms (ECGs) on Day 1 of each cycle in addition to previously specified baseline, end-of-treatment, and as-required ECGs8. The text on excluded concurrent therapies was clarified for consistency with the remainder of the protocol9. The inclusion criterion regarding cancer-evaluation imaging at baseline was amended to allow a bone scan to be conducted up to 8 weeks before randomization to be used as the baseline scan10. Screening study assessments should be performed within specified time periods relative to randomization11. The instructions regarding HER2 status determination were changed in order to reflect the current practices regarding laboratory accreditation and usage of testing kits.

26 January 2012	<p>Amendment 6 modified inclusion criteria defining the specification for prior treatment with taxane and anthracycline therapy in subjects who relapsed over 12 months following the end of treatment and clarifications were made.</p> <ol style="list-style-type: none"> 1. The inclusion criterion regarding baseline cancer evaluation imaging was amended to allow the baseline bone scan to have been conducted up to 12 weeks before randomization 2. Detailed guidelines on baseline criteria for laboratory evaluations were provided. 3. Re-screening was permitted in cases in which the subject's eligibility for the study depended on the completion of further treatment, or to allow protocol compliant time lines for assessment or washout periods 4. Detailed guidelines on dose modifications, dose interruptions, and criteria for re-introduction of study medications in response to hematologic toxicities based on the CTCAE v4.0 grade of events
03 September 2013	<ol style="list-style-type: none"> 1. The original assumption of a 1-sided alpha of 0.025, power of 98% and a randomization ratio of 1:1 between treatments for 363 PFS events (for progression events based on central radiology review) to detect a 66.7% increase in PFS was amended to an assumption of a 1-sided alpha of 0.025, power of 92.8% and a randomization ratio of 1:1 between treatments for 250 PFS events (including progression events based on central radiology review and death, if death occurs before disease progression) to detect a 66.7% increase in PFS 2. The following statement: "assuming a median OS of 12 months for the control group, approximately 270 deaths would be expected at the time of the PFS analysis. For the final analysis of OS, 405 deaths are projected to occur by approximately 43.3 months after the first subject is randomized" was amended to "assuming a median of 12 months for the control group, approximately 270 deaths would be expected at the time of the PFS analysis. However, at the time approximately 250 PFS events are reached, if the observed number of deaths is less than approximately 270, the trial will continue and remain blinded until approximately 270 deaths are observed. In such a case, the analysis of PFS will include all PFS data up to the later data cutoff date for approximately 270 deaths. For the final analysis of OS, and based on actual events, 405 deaths are projected to occur by approximately 56.2 months after the first subject was randomized." 3. DCR was added as a secondary end-point.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Results of exploratory analysis of biomarkers are anticipated in the month of February, 2016.
Occurrence of "±" in relation with geometric CV (%) is auto-generated and cannot be deleted.

Notes:
