

Clinical trial results:

A randomised, double-blind, parallel group, multicentre study of Fluticasone Furoate/GW642444 Inhalation Powder, Fluticasone Furoate Inhalation Powder alone, and Fluticasone Propionate alone in the treatment of persistent asthma in adults and adolescents

Summary

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	02 December 2011
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	18 October 2011
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to compare the efficacy and safety of Fluticasone Furoate (FF)/GW642444 Inhalation Powder 200 microgram (mcg)/25 mcg administered once daily each evening to FF Inhalation Powder 200 mcg administered alone once daily each evening in adolescent and adult subjects 12 years of age and older with persistent bronchial asthma over a 24 week treatment period.

Protection of trial subjects:

The following steps were taken to protect trial participants:

- 1). Only participants meeting all of the inclusion criteria and none of the exclusion criteria were randomized to investigational medication.
- 2). All participants enrolled into the study were provided rescue medication for use as necessary.
- 3). The investigator or treating physician could have unblinded a participant's treatment assignment in the case of an emergency, when knowledge of the study treatment was essential for the appropriate clinical management or welfare of the participant.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	10 June 2010
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Romania: 241
Country: Number of subjects enrolled	Japan: 106
Country: Number of subjects enrolled	Poland: 163
Country: Number of subjects enrolled	Germany: 122
Country: Number of subjects enrolled	Russian Federation: 246
Country: Number of subjects enrolled	United States: 328
Worldwide total number of subjects	1206
EEA total number of subjects	526

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37	0

wk	
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	65
Adults (18-64 years)	991
From 65 to 84 years	150
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Participants (par.) meeting eligibility criteria at the Screening visit entered a 4-week Run-in Period for completion of Baseline (BL) safety evaluations and to obtain BL measures of asthma status. Par. were then randomized to a 24-week Treatment Period. 1206 par. were screened, 587 were randomized, and 586 received ≥ 1 dose of study treatment.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	FF 200 µg OD

Arm description:

Participants received FF 200 microgram (µg) inhalation powder via a Dry Powder Inhaler (DPI) once daily (OD) in the evening plus placebo via the DISKUS/ACCUHALER twice daily (BID), for 24 weeks. Additionally participants were provided with albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.

Arm type	Experimental
Investigational medicinal product name	fluticasone furoate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

200 µg once daily

Arm title	FF/VI 200/25 µg OD
------------------	--------------------

Arm description:

Participants received Fluticasone Furoate/Vilanterol (FF/VI) 200/25 µg inhalation powder via a DPI OD in the evening plus placebo via the DISKUS/ACCUHALER BID, for 24 weeks. Additionally participants were provided with albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.

Arm type	Experimental
Investigational medicinal product name	fluticasone furoate/vilanterol
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

200 µg/25 µg once daily

Arm title	FP 500 µg BID
------------------	---------------

Arm description:

Participants received Fluticasone Propionate (FP) 500 µg inhalation powder via the DISKUS/ACCUHALER BID plus placebo via a DPI OD in the evening, for 24 weeks. Additionally participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.

Arm type	Active comparator
Investigational medicinal product name	fluticasone propionate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

500 µg twice daily

Consent withdrawn by subject	13	4	7
Adverse event, non-fatal	3	7	2
Lost to follow-up	2	-	1
Lack of efficacy	21	6	18
Protocol deviation	5	3	5

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline data were collected in members of the Intent-to-Treat (ITT) Population, comprised of all participants who were randomized to treatment who received at least one dose of study medication. Randomized participants were assumed to have received study medication unless definitive evidence to the contrary existed. A total of 1206 participants were screened (enrolled), 587 were randomized, and 586 received at least one dose of study medication.

Baseline characteristics

Reporting groups

Reporting group title	FF 200 µg OD

Primary: Change from Baseline in clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 24-week Treatment Period

End point title	Change from Baseline in clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 24-week Treatment Period
End point description: FEV1 is a measure of lung function and is defined as the maximal amount of air that can be forcefully exhaled in one second. Trough FEV1 is defined as the clinic visit (pre-bronchodilator and pre-dose) FEV1 measurement taken at the clinic visit while still on treatment. Pre-dose and pre-rescue albuterol/salbutamol trough FEV1 was measured electronically by spirometry in the evening at the Baseline (BL) through Week 24 clinic visits. The highest of 3 technically acceptable measurements was recorded. BL was the pre-dose value obtained at Visit 3. Change from BL was calculated as the Week 24 value minus the Baseline value. The analysis was performed using an Analysis of Covariance (ANCOVA) model with covariates of BL trough FEV1, country, sex, age, and treatment group. The last observation carried forward (LOCF) method was used to impute missing data, in which the last non-missing post-BL on-treatment measurement at scheduled clinic visits was used to impute the missing measurements.

Notes:

[4] - Non-inferiority is demonstrated if the lower limit of the confidence interval (CI: 0.025, 1-sided significance level) for the mean difference in change from Baseline in clinic visit trough FEV1 of FF 200 µg OD versus FP 500 µg BID was greater than -125 milliliters.

Primary: Change from Baseline in weighted mean serial FEV1 over 0-24 hours post-dose at Week 24

End point title	Change from Baseline in weighted mean serial FEV1 over 0-24 hours post-dose at Week 24
-----------------	----------------------------------------------------------------------------------------

End point description:

FEV1 is a measure of lung function and is defined as the maximal amount of air that can be forcefully exhaled in one second. Serial FEV1 measurements were taken electronically by spirometry at the Baseline and Week 24 clinic visits. Weighted mean was calculated using the 24-hour serial FEV1 measurements that included the pre-dose assessment (within 5 minutes prior to dosing) and the post-dose assessments after 5, 15, and 30 minutes and 1, 2, 3, 4, 5, 12, 16, 20, 23, and 24 hours. At each time point, the highest of 3 technically acceptable measurements was recorded. Baseline was the value obtained at Visit 3. Change from Baseline was calculated as the average Week 24 FEV1 value minus the Baseline value.

Secondary: Change from Baseline in the percentage of rescue-free and symptom-free 24-hour periods during the 24-week Treatment Period

End point title	Change from Baseline in the percentage of rescue-free and symptom-free 24-hour periods during the 24-week Treatment Period
-----------------	----------------------------------------------------------------------------------------------------------------------------

End point description:

The number of inhalations of rescue bronchodilator, albuterol/salbutamol inhalation aerosol, used during the day and night was recorded by the participants in a daily electronic diary (eDiary). Similarly, asthma symptoms were recorded in a daily eDiary by the participants every day in the morning and evening before taking any rescue or study medication and before the peak expiratory flow measurement. A 24-hour period in which a participant's responses to both the morning and evening assessments indicated no use of rescue medication/symptoms was considered to be rescue free/symptom free. The Baseline value was derived from the last 7 days of the daily eDiary prior to the randomization of the participant. Change from Baseline was calculated as the averaged value during the 24-week Treatment Period minus the Baseline value.

Secondary: Change from Baseline in the total Asthma Quality of Life Questionnaire (AQLQ) (+12) score at Week 12 and Week 24

End point title	Change from Baseline in the total Asthma Quality of Life Questionnaire (AQLQ) (+12) score at Week 12 and Week 24
-----------------	------------------------------------------------------------------------------------------------------------------

End point description:

The AQLQ is a disease-specific, self-administered quality of life questionnaire used to evaluate the impact of asthma treatments on the quality of life of asthma sufferers. The AQLQ for 12 years and older (AQLQ [+12]) is a modified version of the AQLQ for use in asthma patients between the age of 12 and 70. The AQLQ contains 32 items in 4 domains: activity limitation (11 items), symptoms (12 items), emotional function (5 items), and environmental stimuli (4 items). For the 32 items on the questionnaire, the response format consists of a seven-point scale, where a value of 1 indicates "total impairment" and a value of 7 indicates "no impairment." The AQLQ total score is defined as the average of the scores from all 32 questions; thus, the total score ranges from 1 (indicates "total impairment") to 7 (indicates "no impairment"). Baseline was the total score obtained at Visit 3. Change from Baseline was calculated as the total score at Weeks 12 and 24 minus the total score at Baseline.

Secondary: Mean change from Baseline in daily morning trough (AM) and evening (PM) Peak Expiratory Flow (PEF) averaged over the first 12 weeks and 24 weeks of the 24-week Treatment Period

End point title	Mean change from Baseline in daily morning trough (AM) and evening (PM) Peak Expiratory Flow (PEF) averaged over the first 12 weeks and 24 weeks of the 24-week Treatment Period
-----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

End point description:

PEF is a measure of lung function and is defined as the maximum airflow during a forced expiration beginning with the lungs fully inflated. PEF was measured by the participants using a hand-held electronic peak flow meter each morning and evening prior to the dose of study medication and any rescue albuterol/salbutamol inhalation aerosol use. Trough PEF is the PEF measured approximately 24 hours after the last administration of study drug. Change from Baseline (defined as the last 7 days prior to randomization of the participants) was calculated as the value of the averaged daily trough AM/PM PEF over 12 weeks and 24 weeks of the 24-week Treatment Period (at Weeks 12 and 24) minus the Baseline value. ITT Population. Different participants may have been analyzed at different time points, so the overall number of participants analyzed reflects everyone in the ITT Population.

Statistical analyses

No statistical analyses for this end point

Secondary: Change from Baseline in the Asthma Control Test (ACT) scores at Week 12 and Week 24

End point title	Change from Baseline in the Asthma Control Test (ACT) scores at Week 12 and Week 24
End point description:	<p>The ACT is a 5-item questionnaire developed as a measure of the participant's asthma control. Questions are designed to be self-completed by the participant and include the following: In the past 4 weeks, "How much of the time did your asthma keep you from getting as much done at work, school or at home?", "How often have you had shortness of breath?", "How often did your asthma symptoms wake you up at night or earlier than usual in the morning?", "How often have you used your rescue inhaler or nebulizer medication (such as albuterol)?" and "How would you rate your asthma control"?</p> <p>The ACT total score is defined as the sum of the scores from all 5 questions, provided all questions have been answered; thus, the total score ranges from 5 (poor control of asthma) to 25 (complete control of asthma). A score of 20 or higher indicates well-controlled asthma. Change from Baseline was calculated as the total score at Week 12 and Week 24 minus the total score at Baseline.</p>
End point type	Secondary

Secondary: Number of participants with the indicated Global Assessment of Change Questionnaire responses at Weeks 4, 12, and 24

End point title	Number of participants with the indicated Global Assessment of Change Questionnaire responses at Weeks 4, 12, and 24
-----------------	----------------------------------------------------------------------------------------------------------------------

End point description:

At the end of Week 4, Week 8, and Week 24/Early Withdrawal, the Global Assessment of Change Questionnaire that assesses changes in asthma symptoms (AS) and rescue medication use (RMU) was completed by the participants. The number of participants who chose the following answers to the questionnaire were determined: much better, somewhat better, a little better, the same, a little worse, somewhat worse, much worse (to assess the changes in asthma symptoms); much less often, somewhat less often, a little less often, the same, a little more often, somewhat more often, much more often (to assess the changes in the frequency of rescue medication use). Different participants may have been analyzed at different time points, so the overall number of participants analyzed reflects everyone in the ITT Population.

Statistical analyses

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Serious adverse events (SAEs) and non-serious AEs were collected from the start of study medication to the end of the treatment period (up to Week 24).

Adverse event reporting additional description:

An on-therapy AE or SAE is defined as an AE with an onset on or after the start date of study medication, but not later than one day after the last date of study medication. SAEs and AEs were collected in members of the ITT Population, comprised of all participants randomized to treatment, who received at least one dose of the study medication.

Reporting groups

Reporting group title	FF 200 µg OD
-----------------------	--------------

Reporting group description:

Participants received FF 200 microgram (µg) inhalation powder via a Dry Powder Inhaler (DPI) once daily (OD) in the evening plus placebo via the DISKUS/ACCUHALER twice daily (BID), for 24 weeks. Additionally participants were provided with albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.

Reporting group title	FF/VI 200/25 µg OD
-----------------------	--------------------

Reporting group description:

Participants received Fluticasone Furoate/Vilanterol (FF/VI) 200/25 µg inhalation powder via a DPI OD in the evening plus placebo via the DISKUS/ACCUHALER BID, for 24 weeks. Additionally participants were provided with albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.

Reporting group title	FP 500 µg BID
-----------------------	---------------

Reporting group description:

Participants received Fluticasone Propionate (FP) 500 µg inhalation powder via the DISKUS/ACCUHALER BID plus placebo via a DPI OD in the evening, for 24 weeks. Additionally participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication as needed.
