

## Clinical trial results:

**A randomised, open-label, multicenter trial to determine safety and efficacy of eculizumab in the prevention of Antibody-Mediated Rejection (AMR) in living donor kidney transplant recipients requiring desensitisation therapy**

### Summary

EudraCT number	2010-019630-28
Trial protocol	GB DE NO NL ES IT SE
Global end of trial date	13 November 2015

### Results information

Result version number	v1 (current)
This version publication date	17 February 2017
First version publication date	17 February 2017

### Trial information

#### Trial identification

Sponsor protocol code	C10-001
-----------------------	---------

#### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT01399593
WHO universal trial number (UTN)	-

### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 July 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	13 May 2014
Global end of trial reached?	Yes
Global end of trial date	13 November 2015
Was the trial ended prematurely?	Yes

Notes:

## General information about the trial

Main objective of the trial:

The main objective of this study was to evaluate the safety and efficacy of eculizumab to prevent AMR in sensitised recipients of living donor kidney transplants requiring desensitisation therapy prior to transplantation. The primary endpoint focused on acute AMR during the first 9 weeks post-transplantation.

Protection of trial subjects:

Vaccination against N. meningitidis at least 14 days prior to study drug initiation and revaccination 30 days later. If not vaccinated 14 days prior, prophylactic antibiotics must have been administered. A booster dose was to be administered 30 days after the initial dose. Pre-transplant infectious disease assessment was performed as part of the screening assessment.

Background therapy:

Patients were to undergo desensitisation therapy according to the practice of the local transplant center prior to transplantation, and this desensitisation practice was to be uniformly applied for all patients at that center throughout the study. The actual length of desensitisation for an individual patient was based on the clinical judgment of the Transplant Center team. Rituximab was prohibited in all patients as part of the pre-transplantation desensitisation therapy due to potential pharmacodynamic interactions.

Evidence for comparator:

The control group was designed to test eculizumab against the best available care (referred to as standard of care, or SOC) consisting of plasmapheresis (PP) and/or intravenous immunoglobulin (IVIg). The best available care consisting of PP and IVIg was chosen because these modalities combined represented the most prevalent therapy reported in the literature and were the best available therapies at the time of this protocol's inception as per the transplant community.

Actual start date of recruitment	02 November 2011
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	36 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 3
Country: Number of subjects enrolled	Norway: 2
Country: Number of subjects enrolled	Spain: 7
Country: Number of subjects enrolled	Sweden: 5
Country: Number of subjects enrolled	United Kingdom: 15
Country: Number of subjects enrolled	France: 10
Country: Number of subjects enrolled	Germany: 2
Country: Number of subjects enrolled	Italy: 6

Country: Number of subjects enrolled	Australia: 5
Country: Number of subjects enrolled	United States: 47
Worldwide total number of subjects	102
EEA total number of subjects	50

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	96
From 65 to 84 years	6
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

Recruitment period lasted from Nov 2011 to Mar 2014. Forty-one sites in Australia, the European Union, and North America participated in this study.

### Pre-assignment

Screening details:

Screening lasted approximately 8 wks. Written consent was provided prior to performing any study-required assessments. Patients who met screening criteria were enrolled and underwent desensitisation therapy prior to transplantation, according to local transplant center practice.

### Pre-assignment period milestones

Number of subjects started	275 <sup>[1]</sup>
Intermediate milestone: Number of subjects	Passed screening: 137
Intermediate milestone: Number of subjects	Randomised: 104
Number of subjects completed	102

### Pre-assignment subject non-completion reasons

Reason: Number of subjects	Physician decision: 13
Reason: Number of subjects	Adverse event, non-fatal: 7
Reason: Number of subjects	Adverse event, serious fatal: 1
Reason: Number of subjects	Enrolment failure: 3
Reason: Number of subjects	Donor or pre-transplantation logistical issues: 62
Reason: Number of subjects	Did not meet inclusion/exclusion criteria: 62
Reason: Number of subjects	Consent withdrawn by subject: 4
Reason: Number of subjects	Failed desensitisation: 18
Reason: Number of subjects	Randomised but not transplanted: 2
Reason: Number of subjects	Passed screening in error: 1

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 275 patients were screened; among them, 102 patients were randomised and transplanted, and received eculizumab or standard of care for up to 9 weeks post-transplantation.

### Period 1

Period 1 title	9-wk treatment and 60-day washout (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

This study was an open-label study.

### Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

<b>Arm title</b>	Eculizumab treatment group
------------------	----------------------------

**Arm description:**

Patients in the eculizumab treatment group were to receive eculizumab starting approximately 1 hour prior to reperfusion of the allograft and then received a set regimen of dosing for 9 weeks post transplantation, as described in the "Dosage and administration details" section. Data reported are summarised for the "Prevention phase" of the study, i.e., 9-week treatment with eculizumab plus an additional 60-day washout period.

Arm type	Experimental
Investigational medicinal product name	Eculizumab
Investigational medicinal product code	eculizumab
Other name	Soliris
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

**Dosage and administration details:**

Eculizumab was administered for 9 weeks according to the following dosing regimen:  
Eculizumab 1200 mg prior to allograft transplantation (Day 0, starting approximately one hour prior to kidney allograft reperfusion), eculizumab 900 mg (Days 1, 7, 14, 21, and 28), and eculizumab 1200 mg (Weeks 5, 7 and 9). All doses of eculizumab were administered intravenously, with median infusion time of 39 minutes.

<b>Arm title</b>	SOC treatment group
------------------	---------------------

**Arm description:**

Patients in the standard of care (SOC) treatment group received prophylactic therapy for acute AMR according to the SOC choice at each participating investigative site, which could have included any combination of PP and IVIg. Patients randomised to SOC who were diagnosed with AMR could have received eculizumab for the treatment of AMR after initially receiving PP and/or IVIg. Data reported are summarised for the "Prevention phase" of the study, i.e., 9-week treatment plus an additional 60-day washout period. For those patients randomised to the SOC treatment group who were switched to eculizumab for treatment of AMR, from that point forward their data were no longer included in the Prevention Phase.

Arm type	Best available care
No investigational medicinal product assigned in this arm	

<b>Number of subjects in period 1</b>	Eculizumab treatment group	SOC treatment group
Started	51	51
Completed	48	49
Not completed	3	2
Adverse event, serious fatal	1	1
Physician decision	1	-
Adverse event, non-fatal	1	-
Transplantectomy	-	1

## Baseline characteristics

## End points

### End points reporting groups

Reporting group title	Eculizumab treatment group
-----------------------	----------------------------

Reporting group description:

Patients in the eculizumab treatment group were to receive eculizumab starting approximately 1 hour prior to reperfusion of the allograft and then received a set regimen of dosing for 9 weeks post transplantation, as described in the "Dosage and administration details" section. Data reported are summarised for the "Prevention phase" of the study, i.e., 9-week treatment with eculizumab plus an additional 60-day washout period.

Reporting group title	SOC treatment group
-----------------------	---------------------

Reporting group description:

Patients in the standard of care (SOC) treatment group received prophylactic therapy for acute AMR according to the SOC choice at each participating investigative site, which could have included any combination of PP and IVIg. Patients randomised to SOC who were diagnosed with AMR could have received eculizumab for the treatment of AMR after initially receiving PP and/or IVIg. Data reported are summarised for the "Prevention phase" of the study, i.e., 9-week treatment plus an additional 60-day washout period. For those patients randomised to the SOC treatment group who were switched to eculizumab for treatment of AMR, from that point forward their data were no longer included in the Prevention Phase.

### Primary: Treatment failure rate

End point title	Treatment failure rate
-----------------	------------------------

End point description:

The primary efficacy endpoint was treatment failure rate, a composite endpoint defined as the occurrence of 1) biopsy-proven acute AMR, 2) graft loss, 3) patient death, or 4) loss to follow-up measured through 9 weeks post-transplantation.

End point type	Primary
----------------	---------

End point timeframe:

9 weeks post-transplantation

End point values	Eculizumab treatment group	SOC treatment group		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	51	51		
Units: Number of patients				
Treatment failure rate	5	7		
Acute AMR	5	5		
Graft loss	0	3		
Death	1	1		
Loss to follow-up	0	2		

### Statistical analyses

Statistical analysis title	Statistical analysis 1 for treatment failure rate
----------------------------	---

---

**Statistical analysis description:**

The analysis was based on full analysis set and analysed by randomised treatment.

Comparison groups	SOC treatment group v Eculizumab treatment group
Number of subjects included in analysis	102
Analysis specification	Pre-specified
Analysis type	superiority <sup>[1]</sup>
P-value	= 0.76
Method	Fisher exact
Parameter estimate	Proportion difference
Point estimate	-3.9
Confidence interval	
level	95 %
sides	2-sided
lower limit	-23.9
upper limit	16.3

**Notes:**

[1] - The primary efficacy variable was a binary outcome variable where patients meeting the composite endpoint of the occurrence of 1) biopsy-proven acute AMR, 2) graft loss, 3) patient death, or 4) loss to follow-up definition at Week 9 post-transplantation were considered treatment failures and all others were considered treatment successes.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Safety was evaluated for all patients through their duration in the study by randomised treatment and, separately, by actual treatment received.

Adverse event reporting additional description:

Serious and non-serious adverse events are summarised for the "Prevention Phase" (i.e., first 9 wks of prophylactic treatment post-transplantation and an additional 60 days for washout). Data from the Prevention Phase are considered as the most relevant given that it includes only data from patients under treatment for the prevention of acute AMR.

Assessment type	Systematic
-----------------	------------

### Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	18.1
--------------------	------

### Reporting groups

Reporting group title	SOC treatment group
-----------------------	---------------------

Reporting group description:

If patient were switched to eculizumab for the treatment of acute AMR, from that point forward their data were no longer included in the Prevention Phase.

Reporting group title	Eculizumab treatment group
-----------------------	----------------------------

Reporting group description:

All patients randomised to receive eculizumab during the Prevention Phase.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 June 2011	Changes implemented as part of a first global amendment included: <ul style="list-style-type: none"><li>- To specify that randomisation was to be stratified by the pre-transplant desensitisation protocol used</li><li>- To specify that all patients must have been re-vaccinated according to current medical guidelines for vaccination use</li><li>- To clarify the use of other therapies in the eculizumab treatment arm</li><li>- To add a secondary endpoint "Treatment failure rate defined as the occurrence of 1) biopsy-proven AMR, 2) graft loss, 3) patient death, or 4) loss to follow-up at Month 12 post-transplantation</li></ul>
04 November 2011	Changes implemented as part of a second global amendment included: <ul style="list-style-type: none"><li>- To update the enrollment and randomisation screening/enrollment</li><li>- To update the diagnosis and main criteria for inclusion/exclusion criteria</li><li>- To specify a maximum of 9 weeks of eculizumab treatment for AMR</li></ul>
04 May 2012	Changes implemented as part of the third global amendment included: <ul style="list-style-type: none"><li>- To update B and T flow crossmatch levels</li><li>- To explain the length of time between signing of the informed consent and transplantation (desensitisation)</li><li>- To explain the timing for patients to receive meningococcal vaccination</li><li>- To add a section describing eculizumab dosing after treatment with FFP</li></ul>
11 February 2013	Purpose of fourth global protocol amendment was to: <ul style="list-style-type: none"><li>- Update the enrollment criteria.</li><li>- Revise the cross-match requirements for patient eligibility and desensitization.</li><li>- Clarify current procedures and explain the reason for the added procedures.</li><li>- Increased the number of planned patients from 80 to 90, requiring an increase in the number of screened patients from 100 to 130 based on revised statistical analysis</li></ul>

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
13 November 2015	The primary composite endpoint, defined as the occurrence of biopsy-proven AMR, graft loss, patient death, or loss to follow-up at Week 9 post-transplantation, did not reach statistical significance. While the primary composite endpoint rate in the eculizumab treatment group was as expected from earlier studies with eculizumab, the rate in the standard of care treatment group (control group) was lower than was expected, based on natural history studies reported in the literature. Given this, the trial was terminated and no analyses of other efficacy endpoints have been performed. No safety signal has been reported to the Sponsor by the independent data monitoring committee.	-

Notes:

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Data interpretation confounded by open-label study with potential reporting bias, unequal exposure to randomised prevention therapy between groups, some patients in SOC arm received eculizumab for treatment of AMR, all patients immunosuppressed.

Notes:
