Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	17 July 2013
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	29 October 2012
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To determine the safety and tolerability of ascending doses of idursulfase-IT administered via a surgically implanted intrathecal drug delivery device (IDDD) once monthly for 6 months in pediatric patients with Hunter syndrome who have cognitive impairment and who have previously received and tolerated a minimum of 6 months of treatment with Elaprase® (idursulfase for intravenous administration)

Protection of trial subjects:

This study was conducted in compliance with the United States (US) Food and Drug Administration (FDA) Institutional Review Board (IRB) regulations in 21 Code of Federal Regulations (CFR) 56 and the International Conference on Harmonisation (ICH) Good Clinical Practice (GCP) guidelines. Cautious dose escalation and rigorous safety monitoring by a DSMB were implemented to ensure patient safety throughout this clinical study.

Background therapy:

All patients, regardless of randomization, received a weekly infusion of Elaprase [0.5 milligram/kilogram, intravenously (IV)].

Evidence for comparator: -

Actual start date of recruitment	18 November 2009
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	30 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 11
Country: Number of subjects enrolled	United Kingdom: 5
Worldwide total number of subjects	16
EEA total number of subjects	5

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	16
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Participants took part in the study at 2 investigational sites from 18 November 2009 to 29 October 2012.

Pre-assignment

Screening details:

Screening of all patients occurred between 0 and 60 days prior to randomization.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Control

Arm description:

Three dose cohorts were planned. Within each dose cohort, patients were randomized to 1 of 2 treatment options: treatment with study drug or no treatment with 4 treated patients per dose group and a total of 4 untreated patients (1-2 untreated patients were assigned in each dose cohort). Untreated patients did not undergo surgical placement of an intrathecal drug delivery device (IDDD) and did not receive Idursulfase-Intrathecal (IT).

Arm type	No intervention
No investigational medicinal product assigned in this arm	
Arm title	Idursulfase IT (1 mg)

Arm description:

The original design of the study was to test the dose levels of 10, 30 and 100 mg. This was based on a calculation of a minimally effective dose around 10 mg, with subsequent dose levels being chosen as increasing half-log steps. During the conduct of the study; however, it became clear that the 10 mg dose elicited a strong pharmacodynamic response, as measured by a dramatic and sustained drop in the cerebrospinal fluid (CSF) glycosaminoglycan (GAG) levels. This indicated the need to explore a lower level as a minimally effective dose level, leading to the introduction of the 1 mg group; replacing the planned 100 mg group. Enrollment of patients in this dose cohort commenced after the last patient had been enrolled in 30 mg dose cohort. Four patients were enrolled in the 1 mg dose cohort, underwent surgical placement of an IDDD, and received 1 mg idursulfase as an IT injection via the IDDD once per month (ie, every 28 days) for 6 months.

Arm type	Experimental
Investigational medicinal product name	Idursulfase
Investigational medicinal product code	
Other name	HGT-2310
Pharmaceutical forms	Injection
Routes of administration	Intrathecal use

Dosage and administration details:

Injected monthly using an intrathecal drug delivery device (IDDD; PORT-A-CATH® II Low Profile™ Intrathecal Implantable Access System)

Arm title	Idursulfase IT (10 mg)
------------------	------------------------

Arm description:

Four patients were enrolled in the 10 mg dose cohort, underwent surgical placement of an IDDD, and received 10 mg idursulfase as an IT injection via the IDDD once per month (ie, every 28 days) for 6 months.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 February 2008	<p>Clarify information and text related to:</p> <ul style="list-style-type: none">• Safety-related stopping rules (such that if any patient experienced a study drug-related, life-threatening [Grade 4] AE or death, or if 2 or more patients experienced a Grade 3 AE considered possibly or probably related to study drug by the sponsor, then the site would be instructed to halt idursulfase-IT administration to all patients).
25 July 2008	<ul style="list-style-type: none">• Allow for surgical insertion of the IDDD (PORT-A-CATH device);• Allow for the addition of 4 patients to participate in screening, baseline, and end of study procedures, but not to receive the IDDD or study drug;• Clarify information and text related to:• Safety-related stopping rules (such that if any patient experienced a study drug-related, life-threatening [Grade 4] AE or death, or if 2 or more patients experienced a Grade 3 AE considered possibly or probably related to study drug by the sponsor, then the site would be instructed to halt idursulfase-IT administration to all patients).• Updating and reformatting of references.
29 October 2008	<ul style="list-style-type: none">• Incorporated an independent review by a DSMB• Allow for proteomic marker testing in plasma and CSF• Clarify information and text related to:• The removal of the abbreviation I2S for the drug product idursulfase• The definition of infusion-related reactions and SAE reporting
21 January 2009	<ul style="list-style-type: none">• Clarify information and text related to:• Secondary endpoints (minor change in text);• Inclusion criteria (added an alternate way to show evidence of early stage Hunter syndrome-related CNS involvement, specifically if the patient is assessed to be between 2 and 3 standard deviations below the mean overall IQ of the healthy population);• Study procedures (clarification of study visit dates, change in text for hearing assessments, addition of X-ray to confirm placement of the device, addition of text regarding neurological screening assessments performed on Day 7);• Clarify that the safety analysis population is to include all enrolled patients;• Include information about an extension study.
08 July 2009	<ul style="list-style-type: none">• Clarify information and text related to:• Removal of redundant text from inclusion criterion 3b;• Removal of the IDDD in patients who discontinue participation in the study;• CSF sampling and measurement of opening pressure;• Study procedures (components of physical examinations, timing of vision and hearing assessment, serum chemistry assessments, urinary GAG assessments, auditory brainstem response, surgical implantation of the IDDD [suture removal, removal of a nonfunctional device], performance of X-ray, timing of neurological assessments, neurodevelopmental/behavioral assessments.)

21 October 2009	<ul style="list-style-type: none"> • Clarify information and text related to: • Dose escalation guidelines (role of DSMB); • Inclusion criterion 1b (add documented mutation of iduronate-2 sulfatase gene as part of eligibility for the trial); • Inclusion criteria 3 (relating to increase in the acceptable range of IQ values – changed from “between 2 and 3 standard deviations below the mean” to “from 2 to 3.5 standard deviations below the mean” • Study procedures (timing of serum chemistry assessments, BRIEF neurobehavioral assessment, removal of local postoperative neurological examination at week 2); • Update to Medical Monitor’s contact information.
23 March 2010	<ul style="list-style-type: none"> • Clarify information and text related to: • Inclusion criteria (increase the acceptable IQ range and description of cognitive impairment in terms of IQ score: an IQ between 77 and 47 (corresponding to a level between 1.5 and 3.5 standard deviations below the mean overall IQ of the healthy population) • Exclusion criteria (revision of IQ criteria consistent with change to inclusion criterion above, minor change to clarify that opening CSF pressure upon lumbar puncture may not exceed 30.0 cm H2O); • Study procedures (revise timing of baseline assessments to precede enrollment/randomization and to be completed in conjunction with confirmatory screening assessments, revise the naming of study visits, institute a delay between randomization and the initial study week for untreated patients to align elapsed time on study with that of treated patients, institute an interim safety follow-up telephone contact for untreated patients, increase the allowable window for the screening visit neurodevelopmental assessments); • Corrections or clarifications to terminologies. • Revise safety objectives of the study to emphasize that the study’s primary objective and respective endpoint is the investigation of the safety and tolerability of idursulfase-IT; • Allow for more than one main clinical site; • Clarify communication between the medical monitor and investigator(s) of reviewed patient safety data.
07 June 2010	<ul style="list-style-type: none"> • Clarify information and text related to: • Feed back from the clinical site regarding the labels describing timing of the study periods and study assessments. The study assessment weeks were modified to revert numbering and titles of study weeks to that described in Amendment 6; • Study procedures (clarify timing of randomization (Day 0), eliminate Day 2 neurological exam, correct timing of the brief neurodevelopmental assessment; • Revise text requiring that all deaths during the study be reported to the IEC/IRB. Expedited reports of study drug-related deaths are to be provided to the IRB; however, reporting of nonrelated deaths is not required by IEC/IRB, and the statement that details reporting unrelated deaths was stricken from the protocol.
16 August 2010	<ul style="list-style-type: none"> • Clarify information and text related to: • Inclusion criteria modified to include: • Pediatric patients from 3 to 17 years of age, inclusive, with Hunter syndrome who have cognitive impairment defined as a measurable IQ of 77 or less • Flexibility in the protocol language such that potentially eligible patients with inadequate cognitive status for full neurodevelopmental testing may still be acceptable for participation in the study; • Study procedures (addition of the BSID-III to the protocol as an alternative to the DASII) • Text was added describing the classification of AEs with respect to study drug, study drug administration device, and associated procedures. • Introductory text was updated with currently available information concerning the safety profiles of idursulfase-IT and Elaprase derived from the current edition of the Idursulfase-IT Investigator’s Brochure. • Minor edits and/or corrections were made to more closely align in-text descriptions of study procedures with tabulations and footnotes in the Schedules of Study Procedures.

09 February 2011	<ul style="list-style-type: none"> • Clarify information and text related to: • The period of time for conduct of screening assessments was extended from 30 days to 60 days; • The timing of patient enrollment during the dose escalation process was modified such that the third and fourth patients within a dose group could both be enrolled upon confirmation of safety following administration of the first dose of study drug to the second patient (previous versions of the protocol required that dosing of the fourth patient be delayed until the third patient had received the first dose of study drug).
26 April 2011	<ul style="list-style-type: none"> • Clarify information and text related to: • The timing of vital sign and urine GAG assessments for treated patients; • Updated safety information concerning idursulfase-IT and Elaprase from ongoing studies; • Introduce an additional dose group (Group 4) of 4 patients to receive 6 monthly doses of idursulfase-IT at a revised lowest planned dose level (1 mg) to be administered during the study. The addition of this new dose group was intended to explore the lower end of the dose-response relationship.
20 July 2011	<ul style="list-style-type: none"> • Clarify information and text related to: • Operational aspects of the study, most notably, adjustments to the timing of PK evaluations; • Updated safety information concerning IDDD and an appendix intended to assist in investigation and management in the event of a mechanical IDDD failure; • Clarify that the 2 no-treatment patients originally intended for the 100 mg cohort would instead be randomized as part of the 1 mg cohort.
10 April 2012	<ul style="list-style-type: none"> • To eliminate evaluation of idursulfase-IT at the highest initially planned dose level of 100 mg • Clarify information and text related to: • Operational aspects of the study, including clarifications to the timing of pre-treatment urine sample and PK blood sample collection, allowance of a time window for vital signs collection • To include up-to-date nonclinical and clinical safety data derived from the annual update of the Idursulfase-IT Investigator's Brochure (data cutoff date 19 January 2012) • To remove information specific to the Smith's Medical IDDD in relation to investigation and management of device failures • To define the Intent-to-Treat (ITT) analysis population as all randomized patients.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Untreated control subjects were not implanted with an IDDD.
Concentration of idursulfase in all CSF samples post single dose of idursulfase-IT were below the lower limit of quantitation of the bioanalytical method; therefore no results are reported.

Notes:
