Notes:

General information about the trial

Main objective of the trial:

To assess the safety and tolerability of long-term epratuzumab treatment in subjects with systemic lupus erythematosus (SLE).

Protection of trial subjects:

Patients were pre-medicated prior to infusion of the investigational medicinal product (IMP) to prevent infusion reactions. During the conduct of the study all subjects were closely monitored.

Background therapy:

Epratuzumab treatment is in addition to the subjects' existing standard care of oral corticosteroids and any immunosuppressants or antimalarials continued from Baseline in the subject's original double-blind study. In SL0012, corticosteroids were not considered to be included in the category identified as "immunosuppressants."
- Subjects who completed SL0006 or SL0008:
For SL0006, the Baseline dose was defined as the dose prior to the first infusion of study drug in SL0003 or SL0004. For SL0008, the Baseline dose was defined as the dose at Visit 2 (Week 0) in SL0007.
- Subjects who participated in SL0009 or SL0010:
The Baseline dose was defined as the dose at Visit 2 (Week 0) in SL0009 or SL0010 for subjects completing the study, or the dose at Visit 1 in SL0012 for subjects who terminated prematurely (at Week 16 or later) due to lack of efficacy in SL0009 or SL0010.

Evidence for comparator:

Not applicable

Actual start date of recruitment	20 July 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Secondary: The percent of subjects meeting treatment response criteria according to a combined response index

End point title	The percent of subjects meeting treatment response criteria according to a combined response index

End point description:

Combined response index is a response variable (yes/no) incorporating the following criteria for achievement of responder status (ie, all criteria must be met to achieve responder status): (1) British Isles Lupus Activity Group (BILAG) improvement, (2) No worsening in Systemic Lupus Erythematosus Activity Index (SLEDAI), (3) No worsening in Physician's Global Assessment of Disease, and (4) No disallowed changes in concomitant medications, with disallowed changes including mainly increases in corticosteroids, immunosuppressants, and antimalarials.
The Full Analysis Subset 1 (FASS1) consisted of all subjects in the FAS who were enrolled in study SL0008 (NCT00660881), SL0009 (NCT01262365) or SL0010 (NCT01261793) prior to enrollment in SL0012, and with available results at the Week 96 time-point.

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 April 2011	The protocol was amended to allow subjects completing the Phase 2, Open-Label-Extension (OLE) studies, SL0006 and SL0008, to enroll in SL0012. In addition, a few clarifications, inconsistencies, and typographical errors were made/corrected within the protocol text.
03 February 2012	The protocol was amended for the following reasons: - To add an additional treatment arm of epratuzumab 1200 mg every other week (QOW) to collect long-term safety data on this dose in a Phase 3 open-label study, in addition to safety data currently being collected in the Phase 3, placebo-controlled, double-blind studies (ie, in SL0009 and SL0010). - To update the statistical considerations (Section 14.2 and Section 14.8 of the protocol) in accordance with addition of the epratuzumab 1200 mg QOW treatment arm. - To clarify the guidance for concomitant corticosteroid use in Section 7.8.1.1 of the protocol. The previous text allowed corticosteroid increases for up to 1 month. The revised text specified that corticosteroid increases were allowed for up to 30 consecutive days or up to a total of 30 days per study year. - To update criterion 4 of the primary efficacy variable in Section 4.1.1 of the protocol regarding concomitant corticosteroid use, so that it was consistent with the updated text in Section 7.8.1.1 of the protocol described above. The previous text allowed corticosteroid increases for up to 1 month. The revised text specified that corticosteroid increases were allowed for up to 30 consecutive days or up to a total of 30 days per study year. - To add an additional exploratory endpoint for assessment of flares. - To include a list of anticipated serious adverse events (SAEs) in compliance with the recent Food and Drug Administration (FDA) final rule on safety reporting requirements for studies conducted under an open Investigational New Drug Application (FDA, Guidance for Industry and Investigators, 2011). - To change the name and contact information of the Clinical Trial Biostatistician and Study Physician. In addition, a few clarifications, inconsistencies, and typographical errors were made/corrected within the protocol text.
25 March 2013	The protocol was amended for the following reasons: - To extend the study duration for an additional 2 years - To update study contact information - To update SAE reporting information - To update information pertaining to SL0006, SL0008, SL0009, and SL0010 Minor typographical errors were corrected throughout the protocol.

12 May 2014	The protocol was amended at the request of the German Regulatory Authority, Paul Ehrlich Institute to clarify details of the physical examination within the scope of the BILAG assessment, to introduce a list of adverse events (AEs) of special interest that were identified for epratuzumab, and to clarify further actions after identification of an AE of special interest. Additional changes to the protocol were as follows: - Updated study contact information and SAE reporting information - Revised the exploratory endpoints for assessment of flares - Added an additional safety variable (incidence of hospitalizations/emergency room [ER] visits) - Clarified in Exclusion criterion 10 that the laboratory results from SL0009 and SL0010 should not be older than 28 days - Updated the text in Section 7.2.1 of the protocol (Preparation and administration of epratuzumab and placebo) in order to clarify that it was recommended, but not mandatory, that subjects be premedicated before receiving an iv infusion. - Updated the text in Section 7.5 of the protocol (Handling and storage requirements) in order to clarify the process to follow in case of out-of-range temperatures. This was consistent with the description in the Pharmacy Manual. - Updated Table 7-1 of the protocol (Steroid conversion table) with additional corticosteroids to be consistent with the table in the current Statistical Analysis Plan (SAP). - Clarified that investigators may use results of procedures performed at the last visit in SL0009 or SL0010, if performed within 28 days (instead of 4 weeks) of Visit 1 in SL0012. - Modified text in Section 14.4 of the protocol (Safety analyses) to state that infection treatment-emergent adverse events (TEAEs) were to be identified by including all events in the coded system organ class (SOC) "Infections and infestations" rather than via a review of all AE terms prior to study unblinding, as originally planned. This was consistent with the current SAP.
11 May 2015	The protocol was amended to allow an extension of the study duration for potential additional 12-week treatment cycles beyond Week 192 until the approval of the marketing application for the indication of SLE by the FDA or European Medicines Agency (EMA). In addition, procedures if live vaccine was required were clarified and human anti-human antibody (HAHA) was changed to ADA throughout. The protocol amendment 5 has not been implemented due to the decision in September 2015 to terminate the SL0012 study early.
