Clinical trial results:
NAI114373: A Phase III international, randomized, double-blind, double-dummy study to evaluate the efficacy and safety of 300 mg or 600 mg of intravenous zanamivir twice daily compared to 75 mg of oral oseltamivir twice daily in the treatment of hospitalized adults and adolescents with influenza

Summary

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	26 February 2016
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	18 March 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the efficacy of treatment with 600 mg of intravenous (IV) zanamivir twice daily compared to 75 mg of oral oseltamivir twice daily, and 600 mg IV zanamivir compared to 300 mg IV zanamivir twice daily on time to clinical response (TTCR).

Protection of trial subjects:

N/A

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	15 January 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Korea, Republic of: 18
Country: Number of subjects enrolled	Taiwan: 5

Country: Number of subjects enrolled	South Africa: 13
Worldwide total number of subjects	626
EEA total number of subjects	285

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	5
Adults (18-64 years)	400
From 65 to 84 years	189
85 years and over	32

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Male and female adult and adolescent participants >=16 years of age hospitalized with documented influenza or suspected influenza were eligible for enrollment. A total of 626 participants were randomized, and 615 participants were included in the Intent-to-Treat Exposed (ITT-E) Population.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Subject, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	IV zanamivir 300 mg

Arm description:

Participants >=16 years of age received intravenous (IV) zanamivir 300 milligrams (mg) twice daily, adjusted for renal function for 5–10 days.

Arm type	Experimental
Investigational medicinal product name	zanamivir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

300 mg twice daily, adjusted for renal function

Arm title	IV zanamivir 600 mg

Arm description:

Participants >=16 years of age received IV zanamivir 600 mg twice daily, adjusted for renal function for 5–10 days.

Arm type	Experimental
Investigational medicinal product name	zanamivir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

600 mg twice daily, adjusted for renal function

Arm title	Oral oseltamivir 75 mg

Arm description:

Participants >=16 years of age received oral oseltamvir 75 mg twice daily, adjusted for renal function for 5–10 days.

Arm type	Active comparator

Investigational medicinal product name	oseltamivir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

75 mg twice daily, frequency adjusted for renal function

Number of subjects in period 1[1]	IV zanamivir 300 mg	IV zanamivir 600 mg	Oral oseltamivir 75 mg
Started	201	209	205
Completed	175	178	166
Not completed	26	31	39
Adverse event, serious fatal	12	14	11
Consent withdrawn by subject	6	6	8
Physician decision	3	5	10
Adverse event, non-fatal	2	2	1
Lost to follow-up	3	4	9

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.
Justification: Male and female adult and adolescent participants >=16 years of age hospitalized with documented influenza or suspected influenza were eligible for enrollment. A total of 626 participants were randomized, and 615 participants were included in the Intent-to-Treat Exposed (ITT-E) Population.

Baseline characteristics

Reporting groups	
Reporting group title	IV zanamivir 300 mg
Reporting group description:

Reporting group title	IV zanamivir 600 mg
Reporting group description:	
Participants >=16 years of age received IV zanamivir 600 mg twice daily, adjusted for renal function for 5–10 days.	
Reporting group title	Oral oseltamivir 75 mg
Reporting group description:	
Participants >=16 years of age received oral oseltamvir 75 mg twice daily, adjusted for renal function for 5–10 days.	

Primary: Median time to clinical response (TTCR) in participants with confirmed influenza

End point title	Median time to clinical response (TTCR) in participants with confirmed influenza
End point description:	
Clinical response is defined as the resolution of at least 4 of the 5 vital signs (temperature, oxygen saturation, respiratory status, heart rate, systolic blood pressure) within the respective resolution criteria, maintained for at least 24 hours, or hospital discharge, whichever occurred first. The ITT-E Population is comprised of all randomized participants who received at least one dose of investigational product. The Influenza Positive Population (IPP) is comprised of all participants in the ITT-E Population with proven influenza infection. "-99999, 99999" indicates that full range data are not available.	
End point type	Primary
End point timeframe:	
Up to 42 days

Statistical analyses

No statistical analyses for this end point

Secondary: Combined time to clinical response (TTCR) and TTRI

End point title	Combined time to clinical response (TTCR) and TTRI

End point description:

Respiratory Status (RS) is a component of TTCR. Response criteria included the return to the pre-morbid oxygen requirement (participants with chronic oxygen use), a need for supplemental oxygen (administered by any modality: ventilator, non-invasive ventilation, facemask, facetent, nasal canula, etc.) to no need for supplemental oxygen, or a respiratory rate of =<24 breaths/minute (without supplemental oxygen). Data are presented as the percentage of participants acheiving respiratory improvement. This analysis utilizes the Wei-Johanson method.

Statistical analyses

No statistical analyses for this end point

Secondary: Change from Baseline in the Katz Activities of Daily Living (ADL) score and each ADL activity score

End point title	Change from Baseline in the Katz Activities of Daily Living (ADL) score and each ADL activity score

End point description:

The Katz ADL scores were collected for bathing, dressing, toileting, transferring, continence, and feeding activities and were assessed once daily during the treatment period/hospitalization and once at each Post-Treatment Clinic Visit. For the six individual activities, a score of 1 indicates independence, and a score of 0 indicates dependence. The total score is generated by adding the scores of all six activities. A total score of 6 indicates that the participant was independent; a total score of 0 indicates that the participant was very dependent. Baseline is defined as the pre-dose value collected on Study Day 1. Change from Baseline is defined as the difference at each time point (Day 5/6, and Day 10/11, and last day S/R if treatment was extended beyond 5 days) and the end of the study (post-treatment [PT] +28 Days) compared to Baseline. Only those participants available at the specified time points were analyzed.

End point type	Secondary

Statistical analyses

No statistical analyses for this end point

Secondary: Median time to virologic improvement

End point title	Median time to virologic improvement

End point description:

Virologic improvement is defined as a 2 log drop in viral load or sustained undetectable viral ribonucleic acid (RNA) (on two successive occasions) as measured by quantitative reverse transcriptase-polymerase chain reaction (RT-PCR) from nasopharyngeal samples. Nasopharyngeal swabs were collected daily from Baseline through Day 5. If randomized treatment was continued beyond Day 5, samples were taken on Treatment Days 6, 8, 10 and on the last day of randomized treatment. For participants who utilized the Switch (S)/Rescue (R) option, samples were taken on S/R Day 1, S/R Day 3, S/R Day 5, or S/R Day 6, whichever was the last day of S/R treatment. Nasopharyngeal swabs were taken if the participant was symptomatic and continued to be hospitalized on the Post-Treatment +2, +5, +9, +16, and +28 Day assessment. Only those participants available at the specified time points were analyzed (represented by n=X, X, X in the category titles). Data presented is for subjects positive at Baseline.

Nasopharyngeal swabs and endotracheal /BAL samples were collected for viral susceptibility analysis. Susceptibility analyses consisted of phenotyping and genotyping. Resistance mutations were detected by genotyping. Viral susceptibility to zanamivir and oral oseltamivir at Baseline and throughout treatment determined by NA and HA (gene of influenza A and B viruses) sequence analysis and NA enzyme inhibition. Number of participants with viral mutation events are summarized, this includes all resistance mutations (substitutions) i.e. those present at Baseline and those that emerged during treatment.

Statistical analyses

No statistical analyses for this end point

Secondary: Number of participants with any adverse event (AE) considered to be related to study treatment

End point title	Number of participants with any adverse event (AE) considered to be related to study treatment

End point description:

An AE is defined as any untoward medical occurrence in a participant temporally associated with the use of a medicinal product, whether or not considered related to the medicinal product. An AE can therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of a medicinal product. For marketed medicinal products, this also includes failure to produce expected benefits (i.e., lack of efficacy), abuse, or misuse. All AEs were assessed by the Investigator as related or not related to the study treatment. The Safety Population is comprised of all randomized participants who received at least one dose of investigational product and assessed according to their actual treatment received, regardless of the randomization assigned.

Statistical analyses

No statistical analyses for this end point

Secondary: Median quantity of oxygen delivery measured at Baseline (Day 1) and during the study

End point title	Median quantity of oxygen delivery measured at Baseline (Day 1) and during the study

End point description:

The quantity of oxygen delivery were assessed three times daily at Baseline (Day 1) and at Days 2, 3, 4, and 5/6 and once daily during post-treatment +5 days, +16 days, and +28 days. All assessments were to be made at approximately the same time each day (morning, afternoon, and evening) and ideally at least 6 hours apart. The median quantity of oxygen delivery during the study was not summarized since the data was not collected in a way to accurately calculate values. Baseline is defined as the pre-dose value collected on Study Day 1.

End point type	Secondary

End point timeframe:

Baseline (Day 1) and during the study

End point values	IV zanamivir 300 mg	IV zanamivir 600 mg	Oral oseltamivir 75 mg	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	0[94]	0[95]	0[96]

Statistical analyses

No statistical analyses for this end point

Secondary: Number of participants assessed as normal/abnormal (clinically significant [CS] and not clinically significant [NCS]) for 12-lead electrocardiogram (ECG) at Baseline (Day 1) and Day 4

End point title	Number of participants assessed as normal/abnormal (clinically significant [CS] and not clinically significant [NCS]) for 12-lead electrocardiogram (ECG) at Baseline (Day 1) and Day 4

End point description:

On Baseline/Day 1, a 12-lead ECG was obtained within approximately 24 hours prior to dosing. The number of participants with an ECG status of normal and abnormal CS or NCS, as determined by the Investigator, is reported. Normal=all ECG parameters within the accepted normal ranges. Abnormal=ECG findings outside of normal ranges. CS=ECG with a CS abnormality that meets exclusion criteria. NCS=ECG with an abnormality that is not CS nor meets exclusion criteria, per Investigator, based on reasonable standards of clinical judgment. In the original protocol ECGs were also done on Day 4, however amendment 2 removed this requirement and therefore not all participants had Day 4 ECGs. Only those participants available at the specified time points were analyzed (represented by n=X, X in the category titles).

End point type	Secondary

Statistical analyses

No statistical analyses for this end point

Secondary: Serum concentration of intravenous (IV) zanamivir

End point title	Serum concentration of intravenous (IV) zanamivir

End point description:

Pharmacokinetic samples were collected at four time points to characterize peak concentration (end of infusion; C[EOI]) after the first dose on Day 1 and on Day 4 to characterize the pre-dose concentration (C[0]), the peak concentration C(EOI), and the trough concentration at 11-12 hours post-dose (C[12]) of zanamavir. The PK Population is comprised of all participants who received IV zanamivir and underwent sparse PK sampling during the study from which one or more serum zanamivir concentrations was determined. Data was summarised by Creatinine clearance (CL) Category.The dose on Day 1 is the initial dose (unadjusted) and the dose on Day 4 is the maintenance dose. "99999" indicates that data are not available/analysis was not performed.

End point type	Secondary

Adverse events

Adverse events information	
Timeframe for reporting adverse events: Serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from the start of study medication until follow-up (up to 42 days).	
Assessment type	Systematic

Dictionary used	
Dictionary name	MedDRA
Dictionary version	18.0

Reporting groups	
Reporting group title	IV zanamivir 300 mg
Reporting group description: Participants >=16 years of age received intravenous (IV) zanamivir 300 milligrams (mg) twice daily, adjusted for renal function for 5–10 days.	
Reporting group title	IV zanamivir 600 mg
Reporting group description: Participants >=16 years of age received IV zanamivir 600 mg twice daily, adjusted for renal function for 5–10 days.	
Reporting group title	Oral oseltamivir 75 mg
Reporting group description: Participants >=16 years of age received oral oseltamvir 75 mg twice daily, adjusted for renal function for 5–10 days.

occurrences (all)	8	16	10

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
31 January 2011	(i) the liver criteria stopping exemption was deleted, (ii) update and clarification to inclusion criteria 1, 2, 4 and 5, and exclusion criteria 5, 7, 13 and 14, and (iii) update to the background information and some minor clarifications within the protocol. The majority of changes detailed in points (i) and (ii) were made in response to requests from regulatory authorities and Ethics Committees.
01 June 2012	(i) included a contingency study design change to allow for continuation of the study in the event of widespread oseltamivir resistance by temporarily or permanently discontinuing the oseltamivir arm, (ii) removal of exclusion criterion 13 (QTc entry criteria) and removal of Day 4 ECG measurements, and (iii) includes updates and clarifications within the protocol. The major change detailed in point (i) was made in response to comments from regulatory and health agencies to allow the study to be completed in the event of significant oseltamivir resistance developing during the course of the study.
24 January 2014	(i) changes to the data analysis and statistical considerations section of the protocol, including details of a second interim analysis, (ii) included a few clarifications and updates within the protocol. The major change detailed in point (i) was made following the outcome of the first interim analysis where the IDMC recommended that the study continue with all three treatment arms, resulting in an increase to the sample size from 462 to 600 participants. A second interim analysis was included to inform on whether it was appropriate to continue to recruit 600 participants. The statistical analysis framework was updated to allow for consideration of additional evidence beyond the original primary and secondary endpoints.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
