

Clinical trial results:

A randomised, double-blind, placebo-controlled, parallel-group trial to evaluate efficacy and safety of tiotropium inhalation solution delivered via Respimat® inhaler (2.5 µg and 5 µg once daily) over 12 weeks as add-on controller therapy on top of usual care in adolescents (12 to 17 years old) with severe persistent asthma.

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000035-PIP02-09
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	08 April 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	16 October 2013
Global end of trial reached?	Yes
Global end of trial date	16 October 2013
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the trial is to demonstrate superiority of tiotropium (5 µg and possibly 2.5 µg once daily in the evening) over placebo with regard to the primary pulmonary function endpoint after 12 weeks of treatment.

Protection of trial subjects:

The safety of the patients was of paramount importance and was ensured by monitoring the patients closely for AEs.

At-home monitoring of lung function was conducted throughout the entire run-in and treatment periods with the AM3®. The AM3® device was programmed to alert the patient to contact the doctor if significant PEF deterioration occurred or if the patient reported taking high amounts of rescue medication. Patients continued taking their usual maintenance therapy, including ICS and other controller medications and had free access to rescue medication (salbutamol), thus limiting the risk that patients might experience a significant asthmatic adverse event. Moreover, to control acute exacerbations during the trial all patients had access through the investigator to appropriate medications, as medically necessary. To further guarantee the safety of the patients a set of rules leading to withdrawal of patients with severe asthma deterioration was implemented and all procedures and examinations were evaluated for their safety and feasibility in adolescents. Furthermore, an independent Data Safety Monitoring Board was established to monitor safety.

Background therapy:

Patients maintained their background therapy, including ICS in combination with a LABA and/or LTRA and/or sustained release theophylline.

Evidence for comparator: -

Actual start date of recruitment	31 January 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 30
Country: Number of subjects enrolled	Latvia: 57
Country: Number of subjects enrolled	Hungary: 123
Country: Number of subjects enrolled	Bulgaria: 56
Country: Number of subjects enrolled	Australia: 4
Country: Number of subjects enrolled	Guatemala: 26

Country: Number of subjects enrolled	Israel: 8
Country: Number of subjects enrolled	Mexico: 15
Country: Number of subjects enrolled	Portugal: 12
Country: Number of subjects enrolled	Argentina: 67
Country: Number of subjects enrolled	Philippines: 8
Country: Number of subjects enrolled	Ukraine: 88
Country: Number of subjects enrolled	United States: 36
Country: Number of subjects enrolled	South Africa: 24
Worldwide total number of subjects	554
EEA total number of subjects	278

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	1
Adolescents (12-17 years)	553
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

All subjects were screened for eligibility to the trial. Subjects attended sites for the management of adolescent patients diagnosed with asthma which ensure the subjects met all inclusion/exclusion criteria. Subjects were not to be randomised to the trial if any entry criteria were violated. Thus, out of 554 enrolled patients, 329 were randomised.

Period 1

Period 1 title	Treatment period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Tio R2.5

Arm description:

Inhalation of 2.5mcg tiotropium bromide solution once daily for 12 weeks delivered by the Respimat Inhaler, as add on therapy on top of usual care.

Arm type	Experimental
Investigational medicinal product name	Tiotropium Bromide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation solution
Routes of administration	Inhalation use

Dosage and administration details:

2 puffs once daily for a total dose of 2.5 µg that is 1.25 mcg per puff (calculated as free cation, ex mouthpiece, evening dosing) via Respimat inhaler.

Arm title	Tio R5
------------------	--------

Arm description:

Inhalation of 5mcg tiotropium bromide solution once daily for 12 weeks delivered by the Respimat Inhaler, as add on therapy on top of usual care.

Arm type	Experimental
Investigational medicinal product name	Tiotropium Bromide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation solution
Routes of administration	Inhalation use

Dosage and administration details:

2 puffs once daily for a total dose of 5 µg that is 2.5 mcg per puff (calculated as free cation, ex mouthpiece, evening dosing) via Respimat inhaler.

Arm title	Placebo Respimat
------------------	------------------

Arm description:

Inhalation of placebo solution once daily for 12 weeks delivered by the Respimat Inhaler, as add on therapy on top of usual care.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation solution
Routes of administration	Inhalation use

Dosage and administration details:

Two puffs of a solution via Respimat inhaler once daily in the evening.

Number of subjects in period 1^[1]	Tio R2.5	Tio R5	Placebo Respimat
Started	127	130	135
Completed	126	130	132
Not completed	1	0	3
Other reason not defined	1	-	-
Adverse event, non-fatal	-	-	1
Protocol deviation	-	-	2

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics are based on patients who were randomised after successfully completing the screening period and received at least one of the trial medication.

Secondary: Time to First Severe Asthma Exacerbation During the 12-week treatment period

End point title	Time to First Severe Asthma Exacerbation During the 12-week treatment period
-----------------	--

End point description:

Time in days to first severe asthma exacerbation during the 12 week treatment period. The median time to first severe asthma exacerbation was not calculable, so the number of patients who experienced a severe asthma exacerbation are presented for the measured values. A severe asthma exacerbation was defined as a subgroup of all asthma exacerbations that required an initiation of treatment with systemic corticosteroids for at least 3 days or, in case of ongoing and preexisting systemic corticosteroid therapy, requiring at least doubling of previous daily doses of systemic corticosteroids for at least 3 days.

In FAS we have 127, 130, 135 patients. Currently reported numbers are numbers of patients with endpoint during 12 weeks period.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 March 2011	This amendment introduced changes to clarify wording and study procedures/data to be collected, to introduce some administrative changes (e.g. information regarding the planned number of participating countries was updated), and to correct minor typographical errors and inconsistencies between the synopsis, study flow charts, the eCRF, and the text of the protocol, or to align procedures in this protocol with the other tiotropium studies and update the information and risk assessment for tiotropium based on newly available data. It was also clarified that patients could return to their pre-study medication during the follow-up period. Entrance criteria were amended as noted in Section 9.3. Of particular note, to take into account that the trial population spanned a wide range from a 12-year-old child to a 17-year old near-adult, showing enormous heterogeneity with regard to stature, body weight, development status, etc, inclusion criterion no. 4 (dose recommendations for ICS) was adjusted to avoid a bias toward the upper age range of patients.
20 February 2012	This amendment introduced changes to clarify wording and study procedures/data to be collected, to introduce some administrative changes, and to correct minor typographical errors and inconsistencies between the synopsis, study flow charts, the eCRF, and the text of the protocol, or to align procedures in this protocol with the other tiotropium studies. The text was also amended to update information on tiotropium based on recently completed trials and/or recently published data. Rather than specify the number of countries involved in the study, the text was revised to describe this as a multinational study. Entrance criteria were amended as noted in Section 9.3. A significant AE was defined, as follows: hepatic injury defined by the following alterations of liver parameters: an elevation of AST and/or ALT >3 fold ULN combined with an elevation of total bilirubin >2 fold ULN measured in the same blood draw sample. Information was provided to clarify recording of asthma exacerbations as AEs at a withdrawal or follow-up visit. There was a change in the sample size calculation, as a result of which the numbers of patients to be randomised was changed from 64 per treatment group to 125. This was required based on an update of the expected standard deviation for the primary endpoint FEV1 peak 0-3h 300 mL to 420 mL. The planned number of centres was increased from 40 to 80-90 following the increase in the planned sample size.
28 February 2013	This amendment introduced changes to clarify wording and study procedures/data to be collected, to introduce some administrative changes (including a change in the Coordinating Investigator), and to correct minor typographical errors and inconsistencies between the synopsis, study flow charts, the eCRF (including the addition of an eCRF to capture data from the Respimat® dose indicator), and the text of the protocol, or to align procedures in this protocol with the other tiotropium studies. The text was also amended to update information on tiotropium based on recently completed trials and/or recently published data. Entrance criteria were amended as noted in Section 9.3. In addition, there was a change in the sample size description, as a result of which the numbers of patients to be randomised was changed from 125 per treatment group to a total of 375 to clarify that recruitment would continue until overall 375 patients had been randomised.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
